THE DESICCATION (DE VECCHIS) PROCESS OF BEET SUGAR MANUFACTURE*

By C. SCOTT GARRETT, M.B.E., D.Sc. F.I.C.

The process invented and patented by Dr. Inco De Vecchis, of Rome, for the manufacture of sugar from sugar beet differs from the process now in general use in that the sugar beet after being washed and sliced into cossettes is subjected to a drying process. Fresh beet will not keep, and must perforce be extracted when harvested, resulting in an intensive campaign occupying here about three months of the year, or less in warmer climates. Beginning with Schutzenbach in 1837 right up to Lafeuille in recent years, investigators have been unsuccessful in obtaining a process of drying sugar beet, the chief reason being that, through fear of causing alterations in the sugar, they restricted themselves to desiccation at a lower temperature, usually not higher than 50° C. to 60° C. De Vecchis found that, by subjecting

of being stored for a considerable time without deterioration from bacteria, moulds, etc., and have their sugar content quite unchanged. In addition, physical or physico-chemical changes are produced in the cell and cell contents, other than the sugar, which greatly facilitate the subsequent extraction of the latter. These changes have been designated "coagulation of the albumenoid matter," a term which, whilst describing one phase of the change involved, covers other complex changes whose nature is not fully understood, but whose general result is to ease the diffusion of the sugar into warm water and hold back from solution the colloids, albumenoids, and pectic substances.

De Vecchis had to develop a practical system of desiccation conforming to the conditions of his discovery, and

Juice flow diagram

the slices of sugar beet for a certain time to a temperature between 90° C. to 100° C., it was possible to obtain, simultaneously with the almost complete elimination of the water content, the complete coagulation of the albumenoid substances, which would otherwise pass into the warm water with which the beet is subsequently treated. He found also that the physical modifications of the albumenoid substances became more pronounced as the percentage of water in the slices was reduced until finally, at about 3% in weight, the cossettes have a characteristic appearance, are crisp and brittle, and can be crushed by the pressure of the hand. "Cornification" is the name which he has given to the cossettes at this stage. The cossettes dried by this process are capable

having due regard to economy of performance. After long investigation and trials undertaken at considerable expense, there was finally evolved, in collaboration with Messrs. George Scott & Son (London), Ltd., a dryer which fulfilled all the required conditions and has stood the test of practical working. [A complete description of this plant will be given in the paper by Mr. G. W. Riley.]

DRIED COSSETTES

Dried cossettes containing about 3% of moisture are stable, and can be preserved unaltered practically indefinitely. This has been testified by numerous investigators, such as Herzfeld, Grandeau, Hertzog, Benjamin, and by authorities who have had an opportunity of examining the De Vecchis product. Perfectly sound samples have been in existence for over two years

* Paper read at a joint meeting of the Chemical Engineering Group and the Glasgow Section at Glasgow, on October 19, 1927.

in England. It is probable also that the cossettes will keep perfectly with a percentage of moisture up to 10% or 12%, provided the albumenoids etc. are cornificated, i.e., have lost their hygroscopic power, and the material is sterilised.

This fact allows considerable latitude for their preservation in moist climates. If they are left freely exposed to the air, moisture is taken up until equilibrium is reached between the moisture content of the cossettes and the atmosphere. Cossettes are usually stored in bulk in closed sheds, and whilst the upper surface may hydrate to a small extent (about 5%), experience has proved that such hydration does not extend beyond an inch or two in depth. The material can be transported in bulk if precautions are taken to prevent wetting or undue exposure to damp.

Dried cossettes are from 20% to 25% of the weight of the raw beet, and occupy from 120 to 140 cb. ft. per ton, or about half the volume of the wet cossettes. Coefficients of drying of from 3.8 to 5.8 have been obtained in large-scale practice, but these depend on the quality of the beet dried, its percentage of dry substances, including, of course, sugar—a high sugar content leading to a low coefficient.

Cossettes can be briquetted by the application of hydraulic pressure of from 250 to 300 atmos. The compressed cake occupies about 37 cb. ft. per ton.

So long as the conditions of drying laid down by De Vecchis are adhered to, analysis has shown that there is no loss of sugar, either through caramelisation or degradation to invert sugar. On this point a large number of investigators previous to De Vecchis are unanimous, and their results have not been questioned.

In 1925, MM. Ach. Gregoire and Gaspard examined the process, and from samples obtained at the Loreo factory came to the following, among other, conclusions:—

"There is no formation of inverted sugar at the expense of the saccharose during the process of desiccating the cuttings."

"The yield of marketable crystallised sugar is normal."

Prof. Mezzadrioli made a series of analyses on 166 tons of fresh beet. His results, in one series, are as follows:—

Invert ratio before drying, 1.33%.

" " after drying, 1.36%.

In another his average figures were:—

		Invert	Invert Ratio
Fresh cossettes ..	15.26	0.22	1.44
Dried " "	65.0	0.87	1.34

The slight differences in invert ratio shown are within experimental error.

Dr. M. Frigerio, working under the direction of Prof. Menozzi and Munerati, tested hourly samples of cossettes before and after they left the dryer (allowance being made for the time taken to pass through the dryer), and obtained the following results:—

No	Before Drying		Invert		After Drying		Invert
	Polarisation	Less than			Polarisation	Less than	
1.	12°	"	0.10%		61.20°	"	0.60%
2	11.80°	"	0.10%		60.40°	"	0.60%
3	11.40°	"	0.10%		60.86°	"	0.60%
4	11.00°	"	0.08%		61.80°	"	0.60%
5	11.86°	"	0.10%		60.40°	"	0.60%
6.	11.20°	"	0.10%		61.20°	"	0.60%

These investigators concluded that:—"During drying, the percentage of sugar inverted does not increase, but is maintained within the limits of that contained in the fresh slices only, with an increase in proportion to the percentage of water evaporated."

Our own Ministry of Agriculture and Fisheries sent a commission to Italy in the 1924—5 season, which found with Italian beets at the Loreo factory, that the percentages of invert, sucrose, etc., were as follows:—

	Fresh Beet	Dried Beet
Invert	0.27	1.2
Sucrose	12.8	57.5
Invert ratio	2.11	2.10

In the Progress Report issued by the Ministry in August, 1926, in connection with investigations carried out in the small-scale plant installed at Eynsham, Oxfordshire, the conclusion arrived at was as follows:—

"So long as the temperature to which dried or practically dried cossettes were exposed did not exceed 110° C., it was found that no formation of invert sugar or caramel occurred; it was also found essential to remove the moisture quickly, so that the material was not heated in a moist state for any appreciable length of time. When the duration of drying was reduced to one hour or less, the best results were obtained."

The same report also gives the increase in the invert ratio as 0.12%, which is well within experimental error.

At Sanguinetto, in the present season (1927), tests were carried out on quantities of beet* in three periods, and showed the following results:—

	Before and after drying		Invert	Invert Ratio
	Sucrose	Invert		
	Before	After	Before	After
1st. period (ton 223.3 tons beet)	17.2	66.9	0.12	0.47
2nd " " 96.2 " "	16.2	64.8	0.27	1.10
3rd " " 68.7 " "	16.6	66.1	0.28	1.10
	16.9	66.0	0.21	0.84
			1.24	1.27

This shows plainly that there is no practical difference in the invert ratio before and after drying.

In these quantity tests, the average coefficient of drying was 3.9%, so that the efficiency of recovery of total sugar was 100%. Thus we have:—

Original sugar $(16.9 + 0.21) \times 3.9 = 66.73$.

Recovered sugar $66.0 + 0.84 = 66.84$.

Sir William Pope, having had the results of investigations placed before him, has expressed his opinion that these support De Vecchis' contention that no loss of sugar is involved either by caramelisation, inversion, or from any other cause consequent on the desiccation.

It is interesting to note that the Ministry Report places 110° C. as the upper limit of safety in drying. It is a well-established fact that at 120° C. caramelisation of the sugar is already in progress.

EXTRACTION

The dried cossettes are extracted in the same manner as in the diffusion process. De Vecchis uses a battery of from 10 to 12 lixivators (diffusers) of simple construction. Both open and closed types, with and without reheating devices, have been employed, but the closed

* Exceptional Italian crop due to the very dry season.

reheating type is probably the most satisfactory method, since the quicker extraction increases the purity of the juice by about 0.3% to 0.4% without lowering its strength or increasing the sugar content of the exhausted pulp. With this kind of plant, the extraction temperature is 60°/70° C., the circulation being in one direction only in each lixiviator, and charges are made and drawn at about 12 to 15 min. intervals, giving an extraction time of between 2 and 2½ hrs., and it appears possible to reduce this time. With the open-gravity type, up to 4-hrs. extraction time was found necessary.

• Dealing with Italian beet having under the best conditions about 12% to 13% sugar content and a purity about 80% to 82%, the extracted juice showed a strength of 45–50° Brix, when obtained by open type lixiviation. With the closed type it is estimated that a strength of approximately 60° Brix will ultimately be obtained in normal practice.* This strength obtained by a simple process of extraction is a very great contrast to the dilute juice of about 15–17° Brix, obtained by diffusion of freshly cut cossettes.

Moreover, this De Vecchis juice differs essentially from ordinary diffusion juice both in the amount and in the different physical state of the impurities present. Colloidal gels, gummy and pectic states seem to be reduced greatly, leading to a lowered viscosity so that purification (defecation) and filtration, in spite of its great concentration, becomes a relatively simple matter compared with ordinary diffusion juice.

The word "lixiviation" introduced by De Vecchis emphasises the practical difference from the ordinary process which requires a higher temperature (70°–85° C.) and the inversion of the direction of circulation in each diffuser. Scientifically it is claimed that the difference lies in the absence of any osmotic phenomena in the extraction of the dried cossettes.

Some discussion has arisen whether or not the cells are ruptured during the desiccation process. This does not seem at all probable, for if anything like complete cell rupture had taken place one would not expect a limiting strength to the extracted juice such as found in practice. Moreover, the extracted cossettes would in all probability be a shapeless mass of pulp, which is not the case. De Vecchis does not make the claim of cell rupture, although he states that this is possibly present to a slight extent.

EXHAUSTED PULP

The exhausted pulp retains its cossette form and is similar in appearance to the ordinary diffusion exhausted cossettes, and, like the latter, can be either used locally in the wet state, or pressed, dried, and marketed.

In normal working the pulp is extracted to the same degree as in the ordinary diffusion practice. The British Commission found 0.18% sugar at Loreo. There is, however, a difference between this pulp and that obtained from the ordinary process, for since the albumenoid matter of the beet is coagulated by the desiccation and so rendered insoluble, it remains in the exhausted pulp, imparting to it a higher feeding value from its greater nitrogen content.

Experiments by Prof. Mezzadrolì showed that whilst Italian diffusion pulp contained about 4.5%, De Vecchis

* Obtained this season at Sanguinetto.

pulp from the same source contained 7% of dry matter, both reckoned on the wet pulp. The De Vecchis wet pulp averaged 80% and the diffusion pulp averaged 90% of the weight of the fresh beet, so that expressed on the original beet weight the dry matter in the pulp was, for De Vecchis pulp 5.6%, diffusion pulp 4.05%. The difference of 1.55% indicates nitrogenous matter which has not passed into the juice as impurities, and which enhances the quality and quantity of the exhausted pulp by-product.

WASTE WATERS

The "petit-caux" or drain waters from the diffusers do not contain albumenoid matter, and therefore, if these waters are efficiently separated from traces of exhausted pulp, they can be passed to the drain without fear of subsequent decomposition or putrefaction taking place owing to the action of bacteria on the nitrogenous matter. In view of the recent outcry in England against the pollution of streams by drainage from beet sugar factories, this is very important. In Italy the Ministry of Health exempt all De Vecchis factories from any treatment of their waste waters. Strong nitric acid, trichloroacetic acid, alcohol or other ring tests can be used to establish the absence of albumenoid matter in waste liquors or lixiviation juice.

LIXIVIATION JUICE

In the ordinary diffusion process the thin juice obtained from the diffusion battery shows approximately the same purity as the original beet, the increase in purity between diffusion juice and pressed juice usually ranging from 0.2% to 0.5%, but in the De Vecchis process there is a considerable increase in purity.

The Government Commission in 1924 found when the factory were using very poor beet at the tail end of the season the following results:—

	Sugar %	Purity %
Original beet	10.4	72.7
Juice—Dec	7	75.59
" " 8	31.45	70.19
" " 9	30.32	76.32
" " 10	29.5	77.21
At Sanguinetto in 1926, with late harvested beets:—		
Original beet	12.5	76.4
Juice	—	78.8

At Sanguinetto, in August, 1927, with normally harvested beets:—

Original beet	Purity	Lixivated juice
Sugar %	Purity %	Purity %
16.2	82.8	86.0
15.9	85.0	86.7

In the primary stage, therefore, of the De Vecchis process there is an increase in the purity of from 2.5% to 3.5%. The Eynsham experimenters have found the same phenomenon.

DEFECATION

The defecation of this juice, owing to its improved viscous properties and freedom from albumenoid matter, is a simple process indeed compared with the multiple carbonatation and sulphitation processes required to purify ordinary diffusion juice. All that is necessary is the addition of 0.25% calculated on the weight of fresh beets for purities superior to 80%, and for inferior purities about 0.30% of lime as milk of lime. This is

carried out in open vessels fitted with agitating gear and heating coils, the temperature being raised to 80° C.

Approximately twice the percentage of superphosphate (14/16% P_2O_5) (calculated as the lime) is then added, and the temperature raised to 90/100° C. At this point alone in the process is there evolution of ammonia, and the amount is slight. It arises from the small amount of soluble nitrogen compounds present, which are decomposed by the lime and heat. The addition of superphosphate to neutralise the excess of lime and decompose any calcium sucrose formed is another unique feature of the De Vecchis process. The amounts of lime and superphosphate required are very small in comparison with both the weight of the beet and the amount of lime used in the diffusion process, where up to 3% lime on the weight of the beets is necessary. In consequence, the defecated liquor in filtration gives only about one fifth to one sixth the amount of filterpress cake.

FILTRATION

Filtration is easy in consequence of the absence of viscosity and freedom from albumenoid, pectic and gummy substances. Hard granular cakes are obtained which are readily washable, a system of washing being used whereby the wash liquor going forward into the juice is of sufficient strength that there is no appreciable lowering of the strength of the defecated juice. The presence of siliceous sand in the superphosphate contributes to the formation of a suitable filtering mass.

Owing to the relatively small amount of solids in the solution being filtered (one fifth or one sixth of the amount obtained in the diffusion process) it is not necessary or desirable to wash the cakes free from sugar to the same extent, that is, the washed cakes could contain five to six times as much sugar as the washed diffusion cakes without incurring a greater sugar loss at this point. As a matter of fact, there is less loss of sugar in the De Vecchis cakes than in diffusion cakes. Working on 166 tons of beet, Prof. Mezzadrolì found 3% sugar in the filter cakes, which were 2% of the weight of the beets, giving, therefore, an actual loss of sugar of 0.06 to 0.07%, whereas in the ordinary cakes containing from 1 to 1½% of sugar and weighing 10 to 12% of the original beet, the loss of sugar is between 0.10% and 0.18%. These press cakes, containing a large proportion of calcium phosphate, are valuable fertilisers, and by their sale as such will return a proportion of the expense of the defecation. The phosphate exists as bicalcium phosphate, which is considered the best form for vegetable fertilisation. Analyses showed that the amount of phosphorus as pentoxide which was soluble in ammonium citrate or water and ammonium citrate varied from 8.44% to 9%.

EPURATION

The increase of purity as shown analytically for the De Vecchis defecation is not so great as that obtained by the ordinary process, because in the De Vecchis extraction there has already been a purification of 2.5 to 3.5%. The total purification, in extraction and simple defecation together quite equal that produced in the

diffusion process by carbonatations, sulphitations, etc. After passing through a Danek safety filter, the liquor is ready for crystallisation. The following table gives the results of tests in this connection:—

Lixivation juice				Defecation juice				Rise in purity
Brix.	Poin.	Purity	State	Brix.	Poin.	Purity	State	
44.2°	36.4'	82.3%	acid	4.3°	36.3'	84.4%	alk.	2.1
47°	31.8'	77.5%	acid	41.5	33.8'	80.7%	0.05%	3.2
16°	—	78.8%	acid	45°	—	81.8%	0.06%	3.00
46.80°	30.16°	83.60%	—	48.60°	41.91°	86.23%	—	2.63
—	—	86.0%	—	—	—	88.90%	—	2.90
—	—	86.7%	—	—	—	89.40%	—	2.70

Thus, increases of purity due to defecation vary from 2% to 3.2%. In all, lixiviation and defecation together produce from about 5% to 6% or more increase.

It must be clearly understood that this epuration of 5–6% is only possible with low-grade beets. In countries where the beet has an original press juice purity of 86/87%, a lower percentage epuration overall will be experienced by both processes.

CRYSTALLISATION

In the purified juice, after passing the safety filters, is dissolved all the second-product sugar, which brings its strength to 60° Brix. or over. It is now pumped directly to the vacuum pans and concentrated to crystallising point. The massecuite is discharged to the crystallisers and then centrifuged, giving the first-product raw sugar.

Analyses of first massecuites for purity are not strictly comparable with defecated juice, as in continuous working for refined sugar they necessarily contain some second-product sugar, which has been remelted, as well as centrifugal syrup. With this reservation, figures of first massecuites obtained from low-grade material, giving a defecated juice of about 81% to 82% purity are given below:—

	1st product massecuite		
	a	b	c
Brix	92.68	93.6'	92.68'
Sucrose	82.8%	84.8%	83.5%
Invert	—	—	—
Purity	80.3%	80.3%	80.0%
Alkalinity	0.04%	0.02%	0.00%
Ash	2.7%	2.20%	—

With beets of original purity about 83% and defecated juice of 88% to 89% purity, massecuite purity will be 92% or higher.

The refining of the raw product and the further treatment of its mother-liquor syrup are carried out in the normal way. Any successful and economic method of refining raw beet (diffusion) sugar or raw cane sugar is equally applicable to raw De Vecchis process sugar.

The molasses yield from the De Vecchis factories working on Italian beet and producing white refined sugar is quite normal—if anything, a little lower than that obtained by the diffusion process for that grade of beet. From beets of 74% to 76% purity, 6% molasses on the weight of raw beet was obtained at Loreo, whilst a diffusion process factory gave 6½% molasses on the same raw beet supply.

Samples of molasses in last season's work at Sanguinetto showed (on 250 tons):—Brix. 80.6°, sucrose 46%, purity 59.7%, ash 5.7%.

The following are analyses, made in London, of both

the raw sugar and the finished sugar on samples taken from the Loreo factory.

	Brown sugar	White sugar
Sucrose ..	96.6%	99.8%
Moisture ..	2.00%	trace
Ash ..	0.45%	0.05%
Invert ..	nil	nil
Undetermined ..	0.80%	0.15%
	Good smell.	No raffinose.
	Colour somewhat deep.	

At Sanguinetto in the last season :—

	1st product raw sugar			White sugar		
Sucrose ..	99.2%	98.5%	98.7%	Sucrose	99.0%	
Moisture ..	0.6%	0.55%	0.5%	Moisture	traces (0.05%)	
Clendment of refined sugar ..	93.2%	93.75%	93.7%	Ash ..	0.01%	
				Invert ..	—	
				Raffinose	—	

In the diffusion process the thin juice has to be concentrated in multiple effect evaporators before being sent to the vacuum pans with a normal concentration of about 65° Brix., though this is usually 60° Brix. Defecated and filtered juice obtained by the De Vecchis process has normally a concentration of 50° Brix., and may reach 60° Brix. This concentration is further increased by the addition of second-product sugar, green syrup from the refinery, and it is therefore fed directly into the vacuum pan without intermediate evaporators. Even if the concentration is slightly below normal at this point, it is found that the extra work required to be done in the vacuum does not justify the installation of pre-vacuum pan evaporators to bring the concentration to 65° Brix.

In the ordinary process during evaporation ammonia gas is evolved from the nitrogen compounds present in the juice, in spite of its repeated epuration. These compounds can be traced to those large-molecule albumenoid bodies present in ordinary diffusion juice, which require the involved system of epuration practised by that process before they are obtained in a form in which they are decomposed and eliminated by heat. The actual amount of such bodies in ordinary diffusion juice as it arrives at the evaporator is small (about 2—4 cwt. NH_3 per 1000 tons of beet), but it is of great importance that it should be eliminated if only by reason of its molassagenic effect. Sometimes this ammonia evolution calls for special treatment in the multiple effect evaporators. The De Vecchis juice being free from albumenoids gives not a trace of ammonia when concentrated in the vacuum pans, whatever delicate tests may be applied to discover its presence, thus establishing the claim that the quality of this juice is very different from ordinary diffusion juice. Its presence is not, therefore, exhibited in due proportion in figures of purity between the two systems.

ADVANTAGES OF THE PROCESS

By drying the cossettes and rendering them stable and storable, the extraction can be carried out at any time or continuously throughout the year. With continuous working for the same production of sugar, therefore, a De Vecchis plant need only be of one third the capacity of a similar plant using the ordinary system. As, however, the beets are dried only during the beet harvest, the De Vecchis process requires the same size of washing and slicing plant as the ordinary process,

and, in addition, the drying plant and storage accommodation for two thirds of the beet supply in the shape of dried cossettes.

The points in favour of the continuous production of sugar are regulation of supplies according to the demands of the sugar market, and continuous employment at the factory for the operators. As the expense of producing and storing dried cossettes is less than the expense incurred in producing the raw sugar, less money is locked up when the demand for sugar is reduced.

It is not considered an economic proposition to erect a diffusion factory where the prospective supply of beet in the neighbourhood does not amount to 75,000 tons per harvest, certainly not under 50,000 tons. Now, the De Vecchis factories, by reason of their more economical production, can be of smaller total capacity, factories of 20,000 to 25,000 tons per annum being possible, as they are in Italy. Further, it is not always possible to obtain in one compact locality a beet acreage capable of producing 75,000 to 100,000 tons of beet per harvest, and in such cases supplies may have to be drawn from uneconomic distances. With the De Vecchis system, however, a washing and slicing plant, coupled with a drying unit, could be installed in the outlying acreage, and the dried cossettes transported to the factory, saving thereby (owing to the decreased weight) about four fifths of the freightage. Thus, regions which are perfectly good for beet growing, but are too small to support a factory, can be brought into the scheme of beet production and combined to supply or augment the local supply of a large central factory. Such an auxiliary could be installed in a region where a harvest of about 7500 tons of beet was available, and the possibility of this being done by co-operative endeavour of the growers themselves is quite feasible. The system then has a claim to assist in the extension of sugar beet cultivation and to alleviate conditions for growers badly situated with respect to outlets for their beet.

Other advantages mentioned are the increased amount and quality of the exhausted pulp due to its albumenoid content, the fertilising value of the press cakes due to the contained phosphates, and especially the non-putrescible nature of the effluent which makes its treatment a relatively simple and inexpensive matter.

ECONOMICS

Italian conditions differ from English on account of the cheapness of their labour, their cheap supplies of electric power, and their extraordinarily low building costs. A comparison, however, is valid, and whilst exact figures of cost of production cannot be given, the difference can be indicated.

In the subsequent remarks the English equivalent is based on the rate of exchange existing at the time. In 1925—26 the national price for beet was 107 lira, or 17s. 10d. per ton. During that season the De Vecchis Loreo factory paid its growers 125.4 lira, or 20s. 10d. per ton. As the working showed that the yield, which was normal for the Italian beet used, of marketable sugar was 1 ton per 10.8 tons of beet, this amounted to 32s. 5d. extra per ton of sugar produced. The

Sanguinetto factory also can pay growers a better price for their beets and, being thus assured of supplies, is this year doubling its capacity.

Under English conditions, after the experience gained at Eynsham, the Ministry of Agriculture has drawn up estimates of working cost under different scales of operation. Thus:—

Scale	Cost per ton sugar		
	£	s.	d.
100,000-tons factory ...	4	7	6
25,000-tons factory ...	5	8	2

The cost per ton of sugar is taken on a 13.25% extraction, and is exclusive of the cost of the fresh beet and depreciation, but includes all other overhead and standing charges.

The capital cost of De Vecchis installations in this country compiled from the estimates of responsible manufacturers and contractors, can be given as follows:—

	25,000 tons	50,000 tons	100,000 tons
	£	£	£
Plant and erection	46,200	73,700	115,500
Dryers and erection .. .	15,000	25,000	50,000
Buildings and erection, including roads, rails, silos, flumes, &c. .	36,720	59,220	99,300
Total	97,920	157,920	264,800

Allowing, therefore, depreciation at 10% increases the cost of production for a 25,000-ton plant to £8 6s. 11d., and for a 100,000-tons scale to £6 7s. 3d. per ton sugar.

It is difficult to obtain really reliable figures of costs from the English diffusion factories, and figures have been given of from £10 to £15 per ton. We desire, however, a contrast with a successful and well-run factory, where the cost represents a minimum, and have been given such a figure for a 100,000-ton factory of £6 per ton, excluding depreciation. The published cost of erecting such a factory is not far off £400,000, and on the same yield of sugar, depreciation at 10% would add another £3 to the cost.

Compared with the De Vecchis process on the same scale, this amounts to an increased cost of 52s. 9d. per ton of sugar, or, with the smallest scale factory, 13s. per ton of sugar. If the cost of production under the two systems were the same, there would still be a considerable advantage to the new process, owing to this decreased capital expenditure for the same output of sugar. In Italy the difference in capital outlay on factories under the two systems has been placed at about 3 or 4 : 1, but we see from the figures already given that in England the ratio is about 40 : 26.5. The reasons for this reduction of capital expenditure lie in the simplified extraction plant in continuous working, which reduces the size of the extraction and refining plant to roughly one third of that of a diffusion plant of the same capacity, in the elimination of lime kilns, carbonatation plant, sulphitation plant, and multiple-effect evaporators. The washing, slicing and reception equipment will be the same for both plants, whilst the De Vecchis plant

require dryers and a cossette store as items which are not represented in diffusion plants.

De Vecchis has drawn up the following comparison for 100,000-ton plants operating in England.

	Diffusion process	De Vecchis process
	£	£
Beets at 54s. per ton .. .	270,000	270,000
Fuel	10,800	12,900
Wages and salaries .. .	28,250	22,200
Rates, fares and insurances ..	8,000	5,000
Office expenses .. .	2,000	1,800
Consumable stores, bags, limestone, superphosphate .. .	25,500	15,100
Sundries	3,000	1,150

Difference		£35,200

With a production of 13,000 tons of sugar, the difference amounts to 51s. 2d. per ton of sugar.

One item, fuel, is increased, due to the desiccation operation, which requires approximately 600,000 calories (kilogram calories), 2,400,000 B.Th.U., per ton of beet. As the air is heated to a very moderate temperature, a fuel of low calorific power and small cost can be employed; in this particular case, residual smalls of gas-oven coke, which—while it has a calorific value of 5500 to 6000 C. units (10,000—11,000 B.Th.U.)—generally costs less than half the price of high calorific value fuel normally used in sugar factories, the prices being:—Small coke, 12s. to 13s.; ordinary factory coals, 26s. to 30s. per ton, delivered at the factory. This reduces the fuel cost for drying to about 5 to 5½%. and since, for all the remainder of the work, the fuel consumption is restricted to another 4½% to 5% as a maximum, it may be concluded that the greater consumption of coal by the De Vecchis process amounts to the difference between the total of these, 9½% to 10½%, and about 8% or 8½%, which is consumed in the best-equipped and most scientifically-run factories of the normal type producing refined white sugar. On the other hand, many diffusion factories have fuel consumptions of 10% and over. Finality has not been reached in the economy of fuel in the drying process, and it may be possible to recover some of the heat lost in this process.

RELATION TO DIFFUSION PROCESS

The De Vecchis process should not be considered as a possible rival to the diffusion process, but rather as a process which, grafted on to the older process, could double or treble the annual output of these factories. To double the output of a factory capable of handling 100,000 tons of beet by the ordinary process practically the whole plant must be duplicated, involving a capital outlay nearly equal to the original cost of the factory. Working, however, in conjunction with the De Vecchis system, after it has completed the normal campaign, the same extraction and refining plant for treating the dried cossettes, with possibly only minor alterations of pipe work, can be used. The duplication of reception, washing and cutting plant and the installation of the driers and stores could be carried out at a lower capital outlay than

would be involved in the alternative method. Thus, we may roughly estimate :—

	£
To duplicate original 100,000 plant completely (as against £400,000 original cost)	300,000
To instal duplicate reception, washing and cutting plant	40,000
(New) dryers and cossette storage	60,000
Total ...	£100,000

The advantage, therefore, to the factory, is a doubling of output for only 25% increase of capital.

BET SUGAR MANUFACTURE AND THE SUBSIDY

Since the grant of a heavy Government subsidy on sugar manufactured from home-grown beet, some fourteen to fifteen factories have been erected, and there are several more projected, whilst the beet acreage has risen to 200,000 acres. The subsidy declines in two three-year periods from £19 10s. to £13 and £6 10s. per ton of sugar. The present campaign is the last of the £19 10s. subsidy, and no provision is made for the 1934-35 season. If we take one of the oldest, largest, and most successful factories as an example, we may arrive at some conclusion as to whether or not the industry will survive the subsidy. On last year's working the trading profit, not including overhead charges or depreciation, was £307,000, whilst the subsidy was £505,000. About one third of the subsidy is returnable as Excise duty, so that the net subsidation was £337,000. Without the subsidy there would have been a trading loss of about £30,000, which amounts to 3s. 9d. per ton on the 160,000 tons of beet worked. Putting depreciation at £45,000, overheads, including income tax at £60,000, and dividend at £90,000, gives another 24s. 3d. per ton of beet, making in all 28s. per ton.

To maintain the present position, therefore, when the subsidy is removed, the cost of beet must drop by 28s. per ton to 30s. per ton, since the grower at present receives about 58s. per ton. The average of yield is about 8.5 tons of beet per acre, giving at the present price about £24 10s., of which about £18 10s. is swallowed up in costs, whilst at 30s. per ton the return would be £12 15s. Even if by good cultivation and other improvements the yield can be made equal to the high German yield of 10½ tons when the return becomes £15 7s. at a selling price of 30s. per ton, there will be no profit to the farmer.

Although isolated cases occur in which the sugar content of the beet reaches 21%, the average is about 17%, which compares favourably with that of the best beet grown abroad. At present every per cent. over 15½ means an addition of about 2s. 6d. per ton to the basis price of 54s. Given the 10½ tons per acre yield, he would have to increase the percentage of sugar in his beet by over 2½%, keeping the present rate of increase in price with increase in sugar content, to balance his expenditure if the costs of production remained the same, and to make a profit he should have to do considerably better. This does not seem possible with labour conditions as they are at present. Since every per cent. of content up to 15½% costs 3s. 6d., and

any per cent. over this costs only 2s. 6d., the factory under the present system gets cheaper sugar in the higher per cent. beet and to this extent it would benefit.

Even if the factory reduced both its dividend and its overhead by 50%, which would bring the price up to 38s. 4d. per ton, or £16 5s. 10d. per acre on the present yield of 8.5 tons, or £19 12s. 11d. on the average of 10½ tons, still it would not be a paying proposition to the farmer unless he either reduced costs or obtained a higher percentage of sugar than 17%. We have assumed here that with the extinction of the subsidy the Excise duty is also extinguished, but if this is not so, then for the example taken an additional £168,000 would have to be found or a reduction of the price of beet by 21s. per ton, leaving a price of only 17s. 4d. per ton.

At present a 100,000 factory costing £400,000 pays about 58s. per ton for beet of 17% sugar content. With a total extraction of 94%, a high extraction efficiency, 13½ tons of sugar and about 4½ tons of molasses are obtained from 100 tons of beet. A subsidy of about £286 10s., or 57s. 4d. per ton of beet, will be received on this production, making the actual payment by the factory for the beets about 1s. per ton. With the extinction of subsidy, how will it face the position? If during the subsidy period reserves have been built up and plant value annually depreciated, say, at 10%, then at the end of the subsidy period the capital value of the factory will have been practically wiped out, and an annual sum of, say, £40,000, or 8s. per ton, will in future be available for purchasing beet. Cutting a dividend charge of 10% and taxes and overheads to the same amount would supply another 16s., whilst another 3s. per ton of beet might be obtained if manufacturing costs were reduced by about £1 per ton of sugar (a very unlikely contingency). Altogether we have 27s. per ton of beet, so that nominally the factory can now afford to pay 28s. per ton of beet. This is just above the price of 25s. to 27s. paid for beet in unsubsidised and unprotected foreign industry, which can place raw or finished sugar on our market. At this price, however, it would seem that the farmer could not possibly produce beet, even with increases both in yield per acre and sugar content. For the first period of reduced subsidy, commencing next season, the National Farmers' Union, in agreement with the manufacturers, has recommended to its branches a price of 46s. per ton for beet of 15½%, with an addition of 3s. for the first per cent. over and 3s. 4d. for any additional per cent. This represents a price of 50s. 8d. for 17% beet, as against the old price of 57s. 9d., or 7s. reduction for 17% beet and 8s. for 15½% beet. The subsidy reduction of £6 10s. per ton sugar is equivalent at the yield we have taken (80.3%, 17% beet) to 17s. 9d. per ton beet, so that the proposed new scale on the average divides the reduction between the farmer and factory in the ratio 42.33% to 57.66%. If this rate of reduction is accepted, and can be applied to the two subsequent periods, then the farmer may expect ultimately 30s. for 15½% beet and 36s. 9d. for 17% beet. The factory, on the other hand, will have to reduce their overall cost of 1 ton of sugar by about £11 to £12.

The above analysis would seem to show that the cost

of manufacture is in this country about £1 to £2 per ton above foreign costs, and the natural question is can this be reduced? Reduction in manufacturing costs can only be effected by improving the efficiency of the operatives or of the plant. Increase in experience will certainly improve the efficiency of the operators, and may do something to reduce costs. Improvements in the process are unlikely, since the diffusion process has developed a high standard of efficiency from long experience, and keen competition both in the industry itself and against cane sugar producers. As the new plant erected in this country has this high efficiency, it does not seem likely that the gap which would appear inevitable at the end of the subsidy will be closed by the reduction of the cost of manufacture of the sugar by this process. We think, therefore, that the De Vecchis process provides an alternative way out of the impasse, and may well close this gap, as it appears possible for this process to contribute about 8s. per ton from both lower manufacturing cost and the increased dividends which it opens up. This contribution of 16s. per ton to the price of beet, with the other savings, should enable the industry to stand on its own feet.

Owing to the munificence of Sir Charles Cottier in presenting the patent rights of this process to the nation, there are no royalties to be paid for its use in this country. Permission to use it is vested in the Ministry of Agriculture by virtue of its connexion with the advancement of agriculture. If this should fulfil that aim, as we think it can, then this gift will have accomplished the purpose its donor had in mind.

In conclusion, we have to acknowledge our indebtedness to Dr. De Vecchis for some of the data we have given, and to Mr. J. H. Lane for some of the references.

CANADIAN MINING AND METALLURGY

The revised statistics give the following figures for lead, copper and silver production in Canada for 1926:—Lead, 283,801,265 lb., valued at \$19,240,661, being a new record for output. Copper production, 133,094,942 lb., valued at \$17,490,300, an increase of 18% in quantity over previous year. Silver, 22,371,924 fine oz., valued at \$13,894,531, a quantitative increase of 10% over 1925.

The Consolidated Mining and Smelting Company will erect, at Trail, B.C., a large contact sulphuric acid plant, utilising the sulphur fumes from the sulphide ores of the district. The first unit will cost over a quarter million dollars.

It is announced that arrangements have been completed whereby the entire blister copper output of the Noranda Mines, Ltd., Rouyn, will be purchased for a term of years at a sliding price scale by the British Metals Co. The production, at the outset, will be about 3,000,000 lbs. monthly, and probably refined at a point on the Atlantic coast.

The zinc-lead ore body of the Buchan Mine, of the Anglo-Newfoundland Development Company, has been found to extend beyond the limits of the company. The ore on the mine property is estimated at 5,000,000 tons, and valued at \$175,000,000.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

NEW MEMBER OF COUNCIL

Lieut.-Col. G. P. Pollitt, D.S.O., has been elected by the Council an Ordinary Member of Council of the Society in place of Dr. E. W. Smith, appointed Honorary Treasurer.

SUSPENSION OF ENTRANCE FEE

The Council has decided to continue the suspension of the Entrance Fee during the year 1928.

ABSTRACTS IN APPLIED CHEMISTRY

It has been arranged to supply members of the Society with reprints of the Abstracts of Applied Chemistry, printed on one side of the paper only, at the price of £1 for the year 1928.

Applications for these accompanied by the appropriate remittance should reach the General Secretary before the end of the present year.

COMMITTEES OF COUNCIL FOR 1927—28

House Committee.—The President, Hon. Treasurer, Dr. E. F. Armstrong, Mr. J. L. Baker, Mr. E. V. Evans, Dr. H. Levinstein, Sir Wm. J. Pope, Mr. Edwin Thompson, and Mr. W. J. U. Woolcock.

Annual General Meeting, New York, 1928, Committee.—The President, Hon. Treasurer, Dr. E. F. Armstrong, Prof. J. W. Hinchley, Mr. Edwin Thompson, and Mr. W. J. U. Woolcock.

Publications (Transactions) Committee.—Messrs J. L. Baker, W. H. Coleman, J. W. Hinchley, W. R. Hodgkinson, E. Grant Hooper, W. F. Reid, and W. G. Wagner.

REPRESENTATIVES ON OUTSIDE BODIES FOR 1927—28

Federal Council for Pure and Applied Chemistry.—Mr. F. H. Carr, Dr. S. Miall, and Mr. W. J. U. Woolcock.

National Physical Laboratory (General Board).—Prof. J. C. Philip and Prof. J. W. Hinchley.

British Engineering Standards Association.—Aircraft Sub-Committee on Chemicals: Prof. W. A. Bone. Sub-Committee on Textiles: Mr. C. F. Cross. Sub-Committee on Dopes: Dr. J. N. Goldsmith. Sectional Committee of Chemical Engineering: Mr. C. S. Garland, Mr. C. J. Goodwin, Dr. W. R. Ormandy, Mr. J. A. Reavell, and Mr. F. H. Rogers. Committee on Sieves and Screens: Mr. F. A. Greene. Committee on "Methods of Analysis of Coal": Mr. E. V. Evans, Mr. H. Hollings, and Mr. T. F. E. Rhead.

Mineral Resources Department of the Imperial Institute.—Lead, Silver, Zinc, and Cadmium Sub-Committee: Mr. H. M. Ridge. Aluminium, Magnesium, Potassium, and Sodium Sub-Committee: Dr. R. Seligman. Minor Metals Sub-Committee: Mr. W. G. Wagner. Publications and Libraries Sub-Committee: Mr. W. J. A. Butterfield. Abstracts Sub-Committee: Prof. H. Louis and Mr. T. F. Burton. Chemical Industries Sub-Committee: Mr. C. S. Garland.

Governing Board of Imperial College of Science and Technology.—Sir Wm. Pearce.

Chemical Society's Library.—Dr. J. P. Longstaff.

Joint Committee for the Standardisation of Scientific Glassware.—Mr. F. H. Carr, Dr. R. T. Colgate, and Dr. Bernard Dyer.

British International Committee on World Power.—Dr. H. Levinstein.

Beilby Memorial Fund Committee.—The President, Hon. Treasurer, and General Secretary.

DEATHS

Liversidge, Archibald, F.R.S. (Original Member), of Fieldhead, George Road, Kingston Hill, Surrey. Emeritus Professor of Chemistry in the University of Sydney, N.S.W. On September 26, 1927.

Sodeau, Dr. William H. (elected 1900), of The Chemical Department, Guy's Hospital Medical School, London, S.E.1. Chemist. On October 5, 1927.

Wilson, Anthony W. (elected 1884), of Felstead, Bentham, Lancaster. Retired Colour Works Manager. On October 22, 1927.

LIVERPOOL SECTION

The opening meeting of the session was held in the Muspratt Lecture Theatre, the University, on October 28. The incoming Chairman, Dr. Alfred Holt, was introduced by Prof. W. H. Roberts, who retired, and a cordial vote of thanks was passed to Prof. Roberts on the motion of the Chairman, seconded by Mr. T. W. Stuart.

The annual prizes were presented, the winners being: The Leverhulme Prize, H. N. Walls, B.Sc., of the Liverpool University; the Society of Chemical Industry Prizes, Senior Prize to Frederick Colin Dawson, and the Junior Prize to Norman Glass. It was announced by the Chairman that Harold Lewis, the winner of the Senior Society of Chemical Industry Prize in 1925, had graduated with first-class Honours in Chemistry, London.

Eighteen Associates of the Section were elected.

The Chairman then delivered his inaugural address, entitled "Chemical industries and Merseyside."

The lecturer said it was difficult to think of Merseyside without the association of chemical industries, and one was apt to forget their early history and the causes which led to their enormous development in this part of the country.

The geographical area of Merseyside, namely, the country within a radius of fifteen miles of Liverpool, together with Wigan and Warrington, was until rather more than a century ago an agricultural rather than an industrial area. The rapid expansion of chemical industries on Merseyside resulted from the fact that owing to the development of transport facilities fuel, salt, limestone, sulphur, and pyrites could readily and cheaply be brought together. Growth was hampered by the salt tax, which was not finally removed until 1823.

The development of water-borne and rail transport originated in this area in 1721, the Liverpool Corporation obtaining an Act of Parliament to make the River Weaver navigable from Frodsham Bridge to Winsford Bridge; thereafter, the salt trade from Cheshire to the Mersey grew rapidly.

Some fifty years later the Bridgewater Canal was opened, followed by others, which gave a great impetus

to the trade of Liverpool, as the vessels coming to that port for salt brought cargoes of china clay, pyrites, etc. The opening of these waterways also ensured a cheap and abundant supply of coal from the Wigan district.

The lecturer detailed the various branches of chemical industry which had flourished on Merseyside. Iron smelting did not develop until the middle of the nineteenth century, but copperas manufacture was of greater antiquity, having been established a hundred years earlier. Copper smelting was carried out on a large scale near Warrington, but later was transferred to St. Helens; in 1766, copper works were established in Liverpool, but owing to the nuisance created they were closed down after a few years.

The glass industry was set up in Liverpool about 200 years ago, and pottery was made here as early as 1643. In the latter connexion it was interesting to note that the partnership entered into between Wedgwood and Bently, as a result of which the Wedgwood ware was conveyed to Liverpool to receive its well-known blue colouring, was arranged at a house in Paradise Street. Sugar has been manufactured in Liverpool since 1667 on the present site of Messrs. Macfie's works.

Among other Merseyside industries dealt with were:—Rosin, turpentine, smalt, ultramarine, carbon dioxide, candles, tanning materials, starch, soap, alkali, acid, bleach, salt, coal-tar products, and matches. The lecturer gave interesting details of the development of alkali and soap manufactures, the earliest soap boiling known in the neighbourhood being at Ormskirk in 1709. In 1814—15 there were eleven soap-boilers in Liverpool, and in 1850 the Merseyside factories made one third of the total quantity produced in Great Britain, and the Mersey exported four fifths of the total export of the country.

On the motion of Prof. Roberts, seconded by Mr. Edwin Thompson, the retiring vice-chairman, a hearty vote of thanks was accorded to the chairman for his address.

CALENDAR OF FORTHCOMING EVENTS

Nov. 4.—*Institution of Mechanical Engineers, Thomas Hawksley Lecture.* Storey's Gate, St. James's Park, S.W.1, at 6 p.m. "Application of X-rays to the study of the crystalline structure of materials," by Sir W. H. Bragg.

Nov. 4.—*Society of Chemical Industry, Manchester Section.* Blackfriars House, Blackfriars Street, Manchester, at 7 p.m. Jointly with the Manchester Sections of the Institute of Chemistry, Society of Dyers and Colourists, and the Manchester Literary and Philosophical Society. "Some new principles in chemotherapy," by Prof. A. G. Green and M. Coplans.

Nov. 7.—*University of London, University College, Gower Street, W.C.1, at 5.15 p.m.* The Gow Lectures on "The colloid chemistry of the rubber industry," by Dr. E. A. Hauser. Prof. F. G. Donnan, C.B.E., will preside. (Also on November 9, 11, 14, 16, and 18.)

Nov. 7.—*Biochemical Society, Rooms of the National Institute for Medical Research, Hampstead, N.W.3, at 5 p.m.* (1) "On a cell-free dehydrogenase obtained from bacteria," by M. Stephenson. (2) "The cause of Andrewes' diazo test for uræmia," by G. A. Harrison. (3) "The equation of alcoholic fermentation," by A. Harden and F. R. Henley. (4) "Presence of histamine in tissue extracts," by W. V. Thorpe. (5) "Note on the fluorescence of ergosterol."

and its cause," by O. Rosenheim. (6) "A few observations concerning phosphagen," by M. G. and P. Eggleton. Demonstrations on "A simple shaker for light objects" will be given by J. T. Irving, and on "A new colorimeter based on Lovibond's colour system," by O. Rosenheim and E. Schuster.

Nov. 7.—Institution of the Rubber Industry, London and District Section. Engineers' Club, Coventry Street, W.1., at 8 p.m. "Permeability of rubber and methods of measuring it," by H. A. Daynes.

Nov. 7.—Society of Chemical Industry, London Section. Rooms of the Chemical Society, Burlington House, Piccadilly, W.1., at 8 p.m. "Recent advances in the hydrogenation of oils." General introduction by E. R. Bolton. Part I. (a) "Selective hydrogenation," (b) "Melting point of hydrogenated oils," by K. A. Williams. Part II. "Hydrogenation of fatty acids and neutral oils," by R. G. Pelly. Part III. "The activity of a nickel catalyst," by E. J. Lush.

Nov. 7.—Society of Dyers and Colourists, Manchester Section. Lecture Room of the Manchester Literary and Philosophical Society, 36, George Street, Manchester, at 7 p.m. "Wetting out agents and other auxiliary products used in dyeing and calico printing," by Dr. Rath.

Nov. 8.—Institution of the Rubber Industry, Liverpool Section. The Common Hall, Hackins Hey, Dale Street, Liverpool.

Nov. 8.—Institution of Petroleum Technologists, House of the Royal Society of Arts, John Street, W.C.2, at 5.30 p.m. "Composition of cracked distillates," by Prof. J. S. S. Braine and T. G. Hunter.

Nov. 8.—Armourers and Brasiers Company, at Royal School of Mines, Prince Consort Road, South Kensington, S.W., at 5.15 p.m. "X-rays and metals," by G. Shearer. (Also on Nov. 15 and 22.)

Nov. 9.—Society of Chemical Industry, Nottingham Section. Jointly with the Midlands Section of the Society of Dyers and Colourists, at University College, Nottingham, at 7.30 p.m. "Action of chlorine and hypochlorous acid on wool," by S. R. Trotman, Dr. E. R. Trotman, and J. Brown.

Nov. 9.—Society of Chemical Industry, Glasgow Section. Jointly with the Institute of Chemistry. "Research in the textile industry," by C. M. Keyworth.

Nov. 9.—Institution of Electrical Engineers, South Midland Centre, The University, Edmund Street, Birmingham, at 7 p.m. "Economic aspects of pulverised fuel," by F. Forrest. "Present and future possibilities of extracting oil from coal," by Prof. A. W. Nash. "Coal analysis in relation to heat value for steam raising," by Prof. K. N. Moss.

Nov. 9.—Institute of Metals, Swansea Local Section. Thomas' Cafe, High Street, Swansea, at 7 p.m. "Pyrometers in works practice," by P. Macmair.

Nov. 10.—Institute of Metals, London Local Section. Royal School of Mines, South Kensington, S.W.7, at 7.30 p.m. "Some metallurgical problems of the electrical industry," by C. C. Paterson.

Nov. 10.—Institute of Brewing, Scottish Section. Caledonian Station Hotel, Edinburgh. "Chemical study of polysaccharides," by Sir J. C. Irvine.

Nov. 10.—Institution of the Rubber Industry, Birmingham and District Section. The Grand Hotel, Birmingham. "Industrial application of latex," by P. Schidrowitz.

Nov. 11.—Oil and Colour Chemists' Association, Manchester Section. "Some problems of varnish films," by Dr. R. S. Morrell.

Nov. 12.—Society of Chemical Industry, Chemical Engineering Group, Rooms of the Chemical Society, Burlington House, Piccadilly, W.1., at 8 p.m. "Some modern methods of recovery of lubricating oils," by A. J. Broughall.

INSTITUTION OF CHEMICAL ENGINEERS

A public lecture was delivered before the Institution by Sir William Bragg, K.B.E., F.R.S., on October 28, the subject being "Crystallisation." The President, Sir Alexander Gibb, G.B.E., C.B., presided.

To the chemical engineer, said Sir William Bragg, crystallisation was a process of the highest industrial importance, and to everyone there was fascination in the regularity and beauty of jewels and crystals of all sorts. It was by no means clear how all natural crystals had grown; the diamond, for instance, was a standing mystery. In the industrial manufacture of crystals, evaporation and cooling were processes in general use, and often "seed" crystals were provided on which larger crystals were to grow. Crystal-growing was a delicate and sometimes uncertain operation, which might be profoundly affected by causes seemingly trivial and little understood. The workman was almost superstitious in his use of "tips and dodges." Mr. Hugh Griffiths in a previous discourse before the Society had told of a visit to a certain salt works where it was the practice, if a certain form of salt crystals was desired, to add a cake of soap to the brine, whereas if a different kind was desired, a cake of blue was added. No one knew why.

The new methods of X-ray analysis depended on the fact that the fine structure of the rays made it possible in a certain sense to "see" fine details of structure which were, and would ever be, hidden from the eye even though aided by the microscope. It was not possible to examine the perfect regularity of the crystal structure and to observe the manner in which the atoms and molecules were fitted together. Such new powers were naturally turned to the question of crystallisation in the hope that solution of odd puzzles might be found. Though the subject was still in its infancy, relative to the growth that seemed to lie before it, yet the X-ray analyst had already thrown some light upon the crystallisation process. As an instance, the new methods emphasised the extreme importance of the perfect regularity of a crystal face: a new molecule depositing itself on that face had to fit, so to speak, exactly into the hole provided for it, and, moreover, had to be presented in the right way. The fit was as exact and as appropriate as that of a key to a lock. Impurity might prevent the process entirely, it might be likened to dirt in the lock or the key. Sometimes a layer of an impurity only one molecule thick might run quickly over a surface, and render it quite inert, and sometimes the impurity might adhere to one type of face on a crystal preventing its further growth, while leaving another face free to grow. For instance, sylvine, a crystal of exactly the same form as ordinary salt, potassium being substituted for sodium, sometimes showed a curious lack of symmetry when treated with an etching fluid: the pits on faces that were expected to show the same results differed in a way that had led crystallographers to suppose an actual want of symmetry in the crystal. It now appeared that the anomaly lay in the presence of a minute quantity of impurity in the etching fluid, an impurity which consisted of molecules either all right-handed or all left-handed. Half of the faces in question had, so to speak, right-handed holes in them and half of them left. The

impurity blocked up one sort and not the other: and so the crystal want of symmetry arose. The minutest trace was sufficient since the poisoning layer need be no more than one molecule thick. Many operations, both in inorganic and organic nature were affected by the presence of minute impurities, and it was not at all unlikely that in many of them the phenomena were analogous. In this and other ways the X-ray analysis was giving a closer insight into crystallisation processes. It was certain that in this way a better understanding would finally be reached, and already there were indications of satisfactory progress.

• The annual reception of the Institution of Chemical Engineers was held by the President, Sir Alexander Gibb, and Lady Gibb at the New Prince's Galleries, Piccadilly, on November 2. Over 450 guests were present at the reception, which was extremely pleasant. Not only was the eye delighted by the forty-fourth exhibition of the Royal Institute of Oil Painters, which was on view, but the Kensington Singers charmed the ear with a number of part songs, old and new, grave and gay, and Mr. Bernard Shore contributed a number of viola solos which ranged from French dances by Marais and a delightful work (though with a lugubrious title) by Bach to modern music by composers such as Glazounov, Debussy, and Kreisler.

Amongst those attending the reception were: the Rt. Hon. the Earl of Lovelace and the Countess of Lovelace, the Lord Meston and Lady Meston, the Hon. Sir Charles Parsons, the Rt. Hon. Sir Alfred Mond Bart. M.P., the Hon. H. Fletcher Moulton, Sir William Leese, Bart., and Lady Leese, Col. Sir Edward Brotherton, Bart., Sir Rowland Blades, Bart. (Lord Mayor of London), and Lady Blades, Sir Frederick and Lady Black, Sir Eustace D'Eyncourt, Lieut.-Gen. Sir William Furse (Director, Imperial Institute) and Lady Furse, Sir Frank and Lady Heath, Sir Robert Elliott-Cooper, Sir Albert Gray, Sir Charles Walker, Vice-Admiral Sir Henry Bruce, Sir Vincent Baddeley, Vice-Admiral Sir Ernie Chatfield, Sir Trevredyn Wynne, Sir Robert B. Dixon and Lady Dixon, the Hon. Sir John Cockburn, Sir Murdoch MacDonald and Lady MacDonald, Sir John and Lady Biles, Sir Lynden Macassey and Lady Macassey, Sir Richard Threlfall, Sir Frederic Nathan (Past President of the Institution) and Lady Nathan, Sir William Pope, Sir Robert and Lady Waley Cohen, Sir John Flett (Director, Geological Survey of Great Britain), Col. Sir John Young, Sir John and Lady Snell, Sir Napier Shaw, Sir Alexander Roger, Sir Gregory and Lady Foster, Sir Richard Gregory, Sir Harry Courthope-Munroe, Sir Alexander Kennedy, Sir Cyril and Lady Kirkpatrick, Sir Ralph Wedgwood, Sir Benjamin and Lady Longbottom, the Mayor of the City of Westminster (Coun. S. P. B. Bucknill) and the Mayoress, the Mayors and Mayoresses of several of the Metropolitan Boroughs, Dr. E. F. Armstrong, Prof. H. E. Armstrong, Mr. and Mrs. Rustat Blake, Col. C. H. Bressey, Dr. J. M. Bulloch and Mrs. Bulloch, Mr. F. H. Carr (President, Society of Chemical Industry) and Mrs. Carr, Mr. and Mrs. R. W. Dana, Adml. H. P. Douglas (Hydrographer of the Navy) and Mrs. Douglas, Mr. C. O. G. Doune (Secretary, University College, London), Dr. W. H. Eccles and Mrs. Eccles, Mr. and Mrs. J. Ferguson, Mr. and

Mrs. C. S. Garland, Adml. J. de Courcy Hamilton and Mrs. Hamilton, Major E. O. Henrici, Mr. W. L. Hichens, Mr. C. W. Hurcomb, Adml. Mark Kerr, Mr. H. P. Macmillan, K.C., and Mrs. Macmillan, Mr. and Mrs. R. E. L. Maunsell, Mr. C. H. Merz, M. R. A. Möllersen (Consul-General for Esthonia) and Mme. Möllersen, Mr. Emile Mond, Mr. Henry Mond, Mr. Robert Mond, Mr. and Mrs. Basil Mott, Mr. and Mrs. Palmer, Mr. L. St. L. Pendred, Mr. H. St. John Raikes, K.C., and Mrs. Raikes, M. V. Rackauskas (Lithuanian Chargé d'Affaires) and Mme. Rackauskas, Mr. L. H. Savile, Dr. T. Franklin Sibly (Principal Officer, University of London), Mr. A. A. Campbell Swinton, Mr. and Mrs. J. Frater Taylor, Mr. H. T. Tizard (Secretary, Department of Scientific and Industrial Research), Dr. J. H. T. Tudsbury (Honorary Secretary, Institution of Civil Engineers), Mr. James Whitehead, K.C., Mr. W. Will, Prof. E. C. Williams, Dr. G. W. Monier Williams, and Prof. J. W. Hinchley (Honorary Secretary of the Institution).

CORRESPONDENCE

MORE REMINISCENCES

SIR, Your correspondent, P. H., writing of his reminiscences, will have reminded many others of their own early days although I myself can refer only to the late nineties. Yet the conditions then were so different from those obtaining now that my experiences may conceivably be of interest, and possibly this letter may induce other correspondents to contribute theirs. As assistant chemist at a factory on the Kentish marshes, I left home (even in winter) at 5.40 a.m. to walk 4 miles along country roads and start work at 6.30. Breakfast from 8.30 to 9.0 a.m. How well I remember frying a rasher over a Bunsen burner on a lead covered sink, surrounded by plant samples of nitric acid and COV.; sometimes dropping the bacon in the sink and having to rinse it under the tap. From 1.0 to 1.30 I ate my sandwiches: no opportunity for reading the newspaper, as a despotic manager forbade newspapers on the factory. At 5.30, nominally, work ceased. But I frequently worked "overtime," superintending the weighing out of acid mixings on the jetty in a nor' easter, in a haze of nitrous fumes and by the light of a cycle-lamp. At 7 again a four-mile walk home. The remuneration for this service was 30s. per week with deductions for Bank holidays and annual leave, but, as a consolation, a gift of 1s. 9d. on Beanfeast day! A yearly holiday was granted under protest: during my first year I was allowed 5 days, which was increased to one week the next year.

Truly, by comparison, the lot of the chemist nowadays is a bed of roses.

Yours faithfully,
W. J. W.

PERSONAL AND OTHER ITEMS

Prof. J. C. Philip has been appointed to succeed the late Sir James Dobbie as an elector to the professorship of physical chemistry at Cambridge.

The Nobel Prize for physiology and medicine for 1926 has been awarded to Prof. J. Fibiger, of Copenhagen, for his work on cancer, and the prize for 1927 to Prof. J. W. von Jauregg, of Vienna, for his work on the treat-

ment of general paralysis of the insane with the virus of malaria.

Mr. A. W. Allen has been appointed editor of the *Engineering and Mining Journal*, in succession to Mr. J. E. Spurr. Mr. Allen, who is an Englishman and a Cambridge man, has done important work in connexion with nitrates and the cyanide process.

Mr. F. W. Sperr, junr., director of research for the Koppers Company, Pittsburgh, has been awarded the 1926 Beal medal of the American Gas Association. Mr. Sperr has thus been awarded the medal twice, as he also received it in 1921.

Mr. W. Richter has been appointed general manager of the paint, lacquer and chemicals department of the E.I. du Pont de Nemours Co., in succession to Mr. W. P. Allen, who, at his own request, has been granted a leave of absence for a year.

The death, at the age of 76, is announced of Mr. E. Steer, J.P., D.L., formerly chairman of Guest, Keen & Nettlefolds.

We regret to announce the death, at the age of 82 years, of Mr. A. W. Wilson, of Felstead, Bentham, Yorks. Mr. Wilson was elected a member of the Society of Chemical Industry in 1884.

The following deaths are announced from Germany : A. Cobenzl, a well-known photochemist ; Prof. L. Darmstädter, the director of the State Library, Berlin.

The late Mr. J. S. Beauford, J.P., manager of the Rio Tinto Copper Co., left £41,700.

New School of Biochemistry at Oxford

The new School of Biochemistry at Oxford, which was opened by the Lord Chancellor on October 21, owes its existence to the Rockefeller Trustees, who offered £55,000 to meet the cost of building and equipping the school and £25,000 for its maintenance, on condition that the University contributed £25,000, or its equivalent in annual income, for maintenance.

The Lord Chancellor said that no university was worthy of the name which did not provide for those who went to it the opportunity of learning the best in all branches of knowledge, including the best scientific training within its reach. Oxford had now, for many years, given its attention to science. He supposed the early pioneers taught physiology, and out of physiology gradually emerged a special branch, which was sometimes called chemical physiology, and in later years biochemistry. He doubted whether any study bore within it greater promise of progress and of benefit to all living things. This branch of science owed very much, in Oxford, to Sir Charles Sherrington. Sir Archibald Garrod also had rendered much help to science in the University and in the preparations for the establishment of that school. By the generosity of Mr. Whitley, of Trinity College, the Whitley chair of biochemistry was founded, and it had been filled, first, too briefly, by Dr. Benjamin Moore, who nevertheless did admirable work, and since by Dr. R. A. Peters, whom they now congratulated on the greater sphere of work about to open before him.

The Rockefeller Trustees, who had already done much to forward the teaching of science, had made a princely

gift for the new school, and the University was contributing largely towards its maintenance. We did not know nearly enough about life and the processes of life. It was important that the science of biochemistry should advance. It might have a great effect upon the health and lives of many people. Speaking on behalf of the University, he said they were very grateful to the Rockefeller Trustees for their gift. With their usual self-effacement, the Rockefeller Trustees were unwilling to have their name put on the building or included as part of its name, but their generous help would never be forgotten. He believed the new structure would prove a powerful encouragement to the study in Oxford of the science of the processes of life, and would hereafter render signal services to the human race.

The new school has been built next to the Department of Physiology, with which it is connected, on two floors, by corridors. It has been designed by Mr. H. Redfern, F.R.I.B.A. The building is three storeys high, and is simple in style, with large windows. The ground floor contains the main lecture theatre for the two departments, and the first floor contains class rooms. The second floor includes research rooms, a professor's research suite, etc.

Among those present at the opening ceremony were : -- Lord Hugh Cecil, M.P., Sir George Buchanan, Sir Jeremiah Colman, Sir Walter Fletcher, Sir F. Gowland Hopkins, Professor of Biochemistry, Cambridge, Sir Bernard Spilsbury, Prof. Barcroft, Cambridge, Dr. H. H. Dale, Prof. H. Euler, Stockholm, Dr. J. S. Haldane, and Dr. R. A. Peters, Whitley Professor of Biochemistry.

British Cotton Research

At the annual meeting of the British Cotton Industry Research Association, on October 18, it was stated that the financial outlook of the Association gave cause for concern, and that a scheme for meeting the cost of the work would have to be evolved. The President, Mr. Kenneth Lea, said that during the present year the work of the Association had cost £49,000, an increase of £1000 over the previous year. In extending a cordial welcome to Dr. R. H. Pickard, F.R.S., the new director of research, the President said that the research staff of the Association, including those in the workshops, now numbered 87. The question of an artificial silk department, to be financed and housed separately, was being reconsidered. [Last year, despite bad trade, Lancashire consumed an amount of artificial silk yarn estimated at 4000 tons, and with the growing use of rayon in conjunction with cotton, many new technical problems have arisen in weaving and dyeing, as well as in finishing the mixed fabrics.]

Fuel Problems

The forthcoming publication of an important treatise on the fuel resources of Great Britain and their utilisation and treatment is announced. Sir Alfred Mond contributes an introduction to the book, which is entitled "Britain's Fuel Problems," and over 50 specialists have written contributions. The introductory articles will deal with fuel economy in America, Germany, France and Belgium, and nine sections will be devoted, respectively, to production, preparation, utilisation (including fuel in iron and steel practice), coal carbonisation, low-temperature distillation, the gasification of

coal, interior heating, the complete utilisation of fuel energy, and refractories. The special library edition of the work, which is now in the Press, will be published at practically net cost (42s.), by "The Fuel Economist."

Recent Advances in the Hydrogenation of Oils

On November 7 the London Section will hear a series of papers describing recent advances in the hydrogenation of oils. The general introduction, to be given by Mr. E. R. Bolton, will touch briefly on the origin of oil hydrogenation, and will compare the processes of hydrogenation by means of powder catalysts with a new continuous process in which a fixed catalyst is employed. The principle of this process will be demonstrated in laboratory apparatus, and lantern slides illustrating the construction and operation of commercial plant will be shown.

The advantages of the continuous process will be discussed, and it will be shown how the composition of the hydrogenated oil may be controlled by altering various factors in the methods of working. Certain of these factors will be dealt with in Part I by Mr. K. A. Williams, who will also deal with the relationship between melting point and selective action.

In Part II Mr. R. G. Pelly will discuss some aspects of the hydrogenation of fatty acids in comparison with neutral oils, and, finally, in Part III, Mr. E. J. Lush will give some observations on the hydrogenation of naphthalene and its bearing on the general question of the activity of a nickel catalyst.

British Association of Chemists

The Annual Dinner will be held at the Hotel Victoria, Northumberland Avenue, on Saturday, November 26, at 7 p.m. There will be several distinguished guests, including a member of the Ministry of Labour. A limited number of tickets (15s. each) is available to non-members; application should be made to the General Secretary as early as possible, but not later than November 19.

Preparation and Technical Applications of Beryllium

Dr. Illig has given an account (*Z. angew. Chem.*) of the preparation and uses of beryllium. The production in quantity is based on an electrolytic process, worked out by Stock and Goldschmidt in 1925, using a fused sodium barium beryllium fluoride as electrolyte. The Siemens and Halske A.-G. has now developed this method, and can put the process on a technical scale as soon as a demand exists. It is estimated that the present price of 6-11 shillings per g. would fall to approximately that of silver with increased production.

The properties of beryllium have proved surprising. The pure metal melts at 1285° is very hard and brittle, and resistant to the atmosphere. It has already found a limited application in the construction of X-ray tubes. Its chief use will, however, be in the form of alloys. The addition of 2% to iron increases the hardness from 100 to 300, and this may be further increased by heat treatment to 500-600. With copper or nickel a beryllium content of 2-3% yields alloys closely resembling bronze in their properties. They have the advantage that they can be worked prior to heat treatment. These alloys are more resistant to corrosion than carbon steel. In their production the use of cheaper poor quality metal

containing 10-20% of aluminium has proved entirely satisfactory. Hitherto little success has resulted from investigations on the alloys of beryllium with magnesium and aluminium; those with other heavy metals are being further studied.

New Swedish Rubber Company

H.M. Commercial Secretary at Stockholm reports that, according to the local press, the Hälsingborgs Gummi A/B, Ryska Gummifabriks A/B, Malmö, and the Skandinaviska Gummi A/B at Viskafors have agreed to amalgamate. The old companies will, for the time being, continue to operate independently. The new company, the Förenade Gummifabrikerna A/B, will have a capital of between 3 and 9 million kronor, and it appears that also Trälleborgs Gummifabrik will participate.

The I. G. Farbenindustrie

According to the *Financial Times*, the holding company of the interests of the I. G. Farbenindustrie A.-G. in the Bergius process has issued a balance-sheet for 1926 disclosing a net profit of 72,140 marks, which is carried forward.

The Trust has now taken over the sales of the products of the Rhenania-Kunheim Chemical Works. Shares of the Rhenania-Kunheim to the amount of 1,600,000 marks were sold by the Rutgerswerke a few months ago, but the new ownership has never been disclosed.

A company has been established with a preliminary capital of 500,000 marks under the title of "Kohlenchemie A.-G.," to co-ordinate the chemical interests of the Ruhr mines in the utilisation of coal.

COMPANY NEWS

ERINOID, LTD.

The trading profit for the year ended August 31, 1927, amounted to £27,000, compared with £40,278 for the previous year. After meeting charges and depreciation the net profit was £17,069, against £30,355. With £1971 dividend from the Compagnie Française de l'Onnilit and £6041 brought in, there was an available sum of £25,081. The dividend was 7%, against 10%, and after transferring £1547 to general reserve (£5000 for previous year), placing £2500 against £5000 to taxation reserve, and allocating £250 to the staff fund, £6992 remained to be carried forward.

CHEMICAL AND METALLURGICAL CORPORATION

An extraordinary meeting will be held on November 7 to pass resolutions authorising the directors to issue any of the 9,500,000 at present unissued new ordinary shares, and increasing the number of directors to 12. The directors propose to erect a modern electrolytic zinc refinery at some place in Europe where electric current is available at an economic price, which will enable the company to dispose of the whole of the constituents of the complex ores as metals, or their compounds, in a manufactured form. As indicated by the chairman at the last meeting, the company has evolved a very satisfactory process for the treatment of the South African platinum-copper-nickel concentrates, and a pilot plant has been in successful operation at the Stratford works. It is now proposed to erect, at Runcorn, a plant for the commercial treatment of these concentrates. The additional capital is required in order to carry out the above policy.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5 - £5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5 -£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market. 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London. 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s. - 6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 10s.—£10 per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£8—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbolic.—Crystals, - 7½d.—8d. per lb. Crude 60's, 2s. 3d.—2s. 5d. per gal.
 Acid Cresylic, 99/100.—2s. 11d.—3s. per gal. 97/99.—2s. 4½d.—2s. 5½d. per gal. Pale, 95%, 2s. 3d.—2s. 4d. per gal. Dark, 95%, 2s. 1d.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—10d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 7d. per gal., ex works in tank wagons.
 Toluene.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7¾d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10½d. per gal. Solvent 95/160, 1s. 3d.—1s. 4d. per gal. Solvent 90/190, 8½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—84s.—87s. 6d. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 6d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—8d. per lb., naked at works.
 Aniline Salts.—8d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb., 100%.
 Benzaldehyde.—2s. 3d. per lb.

Benaidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—5½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—1s. 10d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton

Dinitrochlorbenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

α-Naphthol.—2s. per lb. d/d.

β-Naphthol.—10d. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

p-Nitraniline.—1s. 7d. —1s. 8d. per lb.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—7½d.—8½d. per lb.

p-Toluidine.—2s. per lb., ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—(Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 6½d.—1s. 7½d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 4d. per lb. Technical 11½d.—1s. per lb. Good demand.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Amidol.—9s. per lb. d/d.

Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. 6d. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—9s. 9d.—9s. 10d. per lb. Bismuth Citrate.—9s. 6d.—9s. 9d. per lb. Bismuth Salicylate.—8s. 9d.—9s. per lb. Bismuth Subnitrate.—7s. 9d.—8s. per lb. Bismuth Nitrate.—5s. 9d.—6s. per lb. Bismuth Oxide.—13s. 9d.—14s. per lb. Bismuth Subchloride.—11s. 9d.—12s. per lb. Bismuth Subgallate.—7s. 9d.—8s. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 3d.—2s. 4d. per lb. Potassium. 1s. 9½d.—1s. 10½d. per lb. Sodium.—2s.—2s. 1d. per lb.

Granulated ½d. per lb. less. All spot. Large quantities at lower rates.

Calcium Lactate.—1s. 2d.—1s. 3½d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in carboys; Winchesters, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchesters, 5s. per gal.

Hydroquinone.—2s. 11d.—3s. 2d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—18s.—20s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 8s. 6d.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonat.—8s. 9d.—9s. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2½%.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.

Resorcin.—3s. 9d.—4s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911.—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net.
 Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7½d.—1s. 9d. per lb. Crystal,
 1s. 8½d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—27 10s.—£28 10s. per ton
 according to quantity, delivered U.K.
 Sulphonal.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to
 quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Aubepine (*ex Anethole*).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s.
 per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl
 Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d.
 per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—
 4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—
 (*ex Bois de Rose*) 15s. per lb.—(*ex Shui Oil*) 10s. 6d. per lb.
 Linalyl Acetate.—(*ex Bois de Rose*) 18s. 6d. per lb.—
 (*ex Shui Oil*) 14s. 6d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.
 —1s. 8d. per lb. Vanillin.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb.
 Bergamot.—26s. per lb. Bourbon Geranium.—13s. 6d.
 per lb.
 Camphor.—75s. per cwt. Cananga, Java, 15s. 9d. per lb.
 Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d.
 per oz. Citronella.—Java, 1s. 10d. per lb., c.i.f. U.K.
 port, for shipment over 1928. Ceylon, Pure, 1s. 8d.
 per lb. Clove, pure 5s. 3d. per lb.
 Eucalyptus, Australian.—2s. 2d. per lb. Lavender.—Mont
 Blanc, 28/40%, 17s. per lb. Lemon.—7s. 3d. per lb.
 Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d.
 per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian,
 75s. per oz. Palma Rosa.—10s. per lb. Peppermint
 —Wayne County, 15s. 9d. per lb. Japanese, 8s. per
 lb. Petitgrain.—8s. 6d. per lb. Sandalwood—Mysore,
 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Dec. 26th. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Nov. 10th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Aaronson, and Chemical Waterproofing Corp. Treating porous or fibrous materials. 27,926. Oct. 20.
 Braham. Drying-apparatus. 27,678. Oct. 18.

Carpmael (I.-G. Farbenind.). Manufacture of products by gaseous reaction etc. 27,938. Oct. 20.

Glover. Furnaces. 27,542. Oct. 17.
 Haas, and Zellstofffabr. Waldhof. Indicating and regulating concentration of liquids. 28,038. Oct. 21. (Ger., 20.11.26).

Marks (Carbide & Carbon Chem. Corp.). Recovery of absorbable substances. 28,158. Oct. 22.

Read. Identifying crystals. 27,785. Oct. 19.

Redlich. Preparation of emulsions. 27,970. Oct. 20.

II.—Complete Specifications

9934 (1926). Hammond and Shackleton. Heat-treatment of liquid and solid materials. (278,768.)

14,397 (1926). Tocco and Landi. Rotary chemical furnaces. (278,774.)

18,033 (1926). Berten & Co. See XVII.

18,070 (1926). Karplus. Compositions for preventing boiler scale. (255,865.)

24,193 (1926). Pfandler Co. Heat-exchangers. (265,133.)

26,358 (1926). Savage. See XII.

31,173 (1926). Albersheim and Konheim. Apparatus for determining the viscosity of fluids. (263,781.)

722 (1927). Chicago Pneumatic Tool Co. Processes of transforming heat. (265,562.)

4108 (1927). Capra. Filter-presses (278,940.)

4641 (1927). Gewerkschaft Sachtleben, and Kuppers. Rotary furnaces. (268,308.)

8460 (1927). Cerini. See VII.

13,831 (1927). Hammond and Shackleton. Heat-treatment. (278,985.)

16,619 (1927). Vernay. Thickening filtering apparatus. (275,573.)

18,454 (1927). Kramer, and Hartstoffmetall A.-G. Pulverising-mills. (278,997.)

19,853 (1927). Mulot. Purifying or filtering apparatus for gaseous fluids. (279,000.)

*23,184 (1927). Studenges, fur Gasind. Apparatus for preparing compressed gases. (279,041.)

*27,441 (1927). Feige. Apparatus for carrying out chemical reactions. (279,120.)

II.—Applications

Arnold (Standard Development Co.). Fractionation of hydrocarbon mixtures etc. 28,140. Oct. 22.

Bomke. Preparing hydrogen. 27,551. Oct. 17. (Ger., 16.10.26.)

Bysow. Producing diolefines from naphtha etc. 27,962. Oct. 20.

Chilowsky. Manufacture of gas from heavy oils. 27,914. Oct. 20. (Fr., 27.10.26.)

Craig. Low-temperature distillation of coal etc. 27,842. Oct. 20.

Ellis (Amer. Sheet & Tin Plate Co.). Purifying and drying oil. 21,957. Oct. 20. Separating oil from aqueous emulsions. 27,958. Oct. 20.

Engelhard. Gas analysis apparatus. 27,846. Oct. 17. (U.S., 27.8.27.)

Florentin, Kling, and Matignon. Obtaining light hydrocarbides from complex organic compounds. 27,952. Oct. 20. (Fr., 23.10.26.)

Gordon, Hughes, and Imperial Chem. Industries. Treatment of coal distillation gases. 27,513. Oct. 17.

Hoyois. Treatment of coal, ores, etc. 27,621. Oct. 18. (Belg., 19.10.26.)

Imbert. Producing gas from wood etc. 27,901. Oct. 20. (Ger., 25.10.26.)

Johnson (I.-G. Farbenind.). Recovery of hydrocarbons etc. 27,497. Oct. 17. Manufacture of hydrocarbons of low-boiling point. 27,909. Oct. 20. Eliminating sulphur compounds from gases.

Laing and Nielsen. Distillation of carbonaceous materials etc. 27,831—2. Oct. 19.

Lookwood. Removal of sulphur from mineral oil. 27,971. Oct. 20.

Lucas, and V.L. Oil Processes, Ltd. Cracking liquid hydrocarbons. 27,461. Oct. 17.

Ott. Alcohol fuel. 27,791. Oct. 19.

Ringrose. Apparatus for detecting etc. inflammable gases. 27,853-4. Oct. 20.

Siemens & Halske A.-G. Determination of amount of carbonic acid in flue gases. 27,912. Oct. 20. (Ger., 25.10.26.)

Soc. de Recherches et de Perfect. Industriels. Furnaces for distilling carbonaceous material. 27,570. Oct. 17. (Ger., 15.10.26.)

II.—Complete Specifications

21,749 (1926). Standard Development Co. Purification of hydrocarbon oils containing sulphur. (270,626.)

4916 (1927). Suida. Recovery of acetic acid and other products in the carbonisation of wood. (275,158.)

6375 (1927). Alexander. See IX.

*6609 (1927). Koks- und Halbkoks-Brikettierungs-Ges. Production of semi-coke briquettes from bituminous coal. (279,020.)

*24,915 (1927). Spilker, Zerbe, and Ges. für Teerverwertung. Hydrogenating and splitting hydrocarbons etc. (279,055.)

*25,513-4 (1927). Humphreys & Glasgow, Ltd. Manufacture of mixed gas. (279,059-60.)

*26,443 (1927). I.-G. Farbenind. Hydrogenation of coals, tars, mineral oils, etc. (279,072.)

*27,198 (1927). Corson. Manufacturing hydrocarbons from calcium carbide. (279,095.)

*27,318 (1927). Algernon. Norit Maatsch. Producing and regenerating activated carbon etc. (279,104.)

*27,551 (1927). Bomke. Preparing hydrogen. (279,128.)

*25,570 (1927). Soc. de Recherches et de Perfect. Industriels. Furnace for distilling at low temperature carboniferous material. (279,130.)

III.—Complete Specification

*26,443 (1927). I.-G. Farbenind. See II.

IV.—Applications

Beavis and Schindelmeyer. Production of nitro and amino derivatives of cymene. 27,694. Oct. 18.

Carpmael (I.-G. Farbenind.). Manufacture of benzantraquinone derivatives etc. 27,668. Oct. 18.

I.-G. Farbenind. Manufacture of dinitrohalogen-aryls. 27,684. Oct. 18. (Ger., 18.10.26.) Manufacture of vat dyestuffs. 28,037. Oct. 21. (Ger., 23.10.26.)

Imray (I.-G. Farbenind.). Manufacture of derivatives of pyrazolanthrone. 28,036. Oct. 21.

Scottish Dyes, Ltd., Smith, and Thomas. Manufacture of dyestuffs etc. 27,525. Oct. 17.

Silesia, Verein Chem. Fabr. Separation of mono- and di-alkyl derivatives of aromatic amines. 28,002. Oct. 21. (Ger., 19.11.26.)

Soc. Chem. Ind. in Basle. Manufacture of vat dyestuffs. 27,915. Oct. 20. (Switz., 20.10.26.)

IV.—Complete Specifications

12,283 (1926). Carpmael (I.-G. Farbenind.). Manufacture of vat dyestuffs of the anthraquinone series. (278,771.)

17,684 (1926). Dicker (Verein f. Chem. Ind.). See XX.

19,311 (1926). Thomson, Thomas, and Scottish Dyes, Ltd. Dyes and dyeing. (278,834.)

26,332 (1926). I.-G. Farbenind., Maennchen, and Hummerich. Producing stable preparations of vat-dyestuffs. (278,890.)

30,158 (1926). I. G. Farbenind. Manufacture of thiazole derivatives of 1:4-naphthoquinone. (262,141.)

20,415 (1927). Carpmael (I.-G. Farbenind.). Manufacture of vat dyestuffs of the anthraquinone series. (279,003.)

*27,684 (1927). I.-G. Farbenind. Manufacture of dinitrohalogenaryls. (279,134.)

V.—Applications

British Celanese, Ltd. Treatment of organic derivatives of cellulose. 28,151. Oct. 22. (U.S., 23.10.26.)

British Celanese, Ltd., and Kinsella. Apparatus for manufacture of artificial silk etc. 28,163. Oct. 22.

Buggenhoudt and Homeyer. Transformation of textile etc. materials. 27,701. Oct. 18. (Belg., 18.10.26.)

Carpmael (I.-G. Farbenind.). Manufacture of cellulose ethers. 28,079. Oct. 21.

Fraser. Preparation of vegetable fibres. 27,763. Oct. 19.

Spinnstoffwerk Glauchau A.-G., and Voss. Washing artificial etc. threads. 28,018. Oct. 21. (Ger., 12.11.26.)

V.—Complete Specifications

9773 (1926). White (Brown Co.). Production of high alpha-cellulose. (278,767.)

18,030 (1926). Courtaulds, Ltd., and Lewis. Manufacture of artificial threads etc. (278,814.)

25,285 (1926). Courtaulds, Ltd., and Topham. Manufacture of artificial threads etc. (278,881.)

8543 (1927). Bemberg A.-G. Manufacture of twisted artificial silk. (268,393.)

*22,461 (1927). I.-G. Farbenind. Opening-up materials containing cellulose. (279,036.)

*27,701 (1927). Buggenhoudt and Homeyer. Transformation of materials having a base of cellulose. (279,137.)

VI.—Applications

Aaronson, and Chemical Waterproofing Corp. 27,926. See I.

I.-G. Farbenind. Dyeing cellulose esters etc. 27,685. Oct. 18. (Ger., 18.10.26.)

VI.—Complete Specifications

19,311 (1926). Thomson, Thomas, and Scottish Dyes, Ltd. See IV.

26,332 (1926). I.-G. Farbenind., Maennchen, and Hummerich. See IV.

*27,685 (1927). I.-G. Farbenind. Dyeing cellulose esters and cellulose ethers. (279,137.)

VII.—Applications

Bomke. 27,551. See II.

Coley. 27,495. See X.

Marks (Louisville Cement Co.). 28,057. See IX.

Pritchard, and United Alkali Co. Production of caustic soda. 28,066. Oct. 21.

Smith. Nickel compounds. 27,784. Oct. 19.

VII.—Complete Specifications

21,561 (1926). Rhodesia Broken Hill Development Co., Ltd. (Stevens, Norris, and Watson). Purification of zinc solutions. (278,851.)

31,275 (1926). Nederlandsche Mijnbouw en Handelsmaatsch. Manufacture of cyanides. (262,802.)

4916 (1927). Suida. See II.

8460 (1927). Cerini. Apparatus for purifying impure solutions of caustic soda etc. (268,385.)

8007 (1927). Lichtenberger and Kaiser. Manufacturing pure sulphate of barium and sulphate of calcium. (268,779.)

*22,466 (1927). App. et Evaporateurs Kestner. Production of nitrate of lime. (279,037.)

*27,551 (1927). Bomke. See II.

VIII.—Complete Specification

18,448 (1926). South Metropolitan Gas Co., and Lamprey. Manufacture of refractories. (278,821.)

IX.—Applications

Ambly. Furnace for producing cement. 27,825. Oct. 19.

Hart, Rodwell, and Roper. Cements, paints, etc. 27,773. Oct. 19.

Marks (Louisville Cement Co.). Burning lime and cement. 28,057. Oct. 21.

Raschig and Raschig. Paving-materials. 27,925. Oct. 20.

IX.—Complete Specifications

17,062 (1926). Garrow. Preparation of organic materials or aggregates for use with cements. (278,788.)

475 (1927). Davies. Magnesium oxychloride coverings. (278,926.)

6375 (1927). Alexander. Manufacturing bituminous products etc. (270,649.)

12,895 (1927). Bates. Artificial marble. (278,983.)

*27,193 (1927). Carl and Riedel. Material for road-beds etc. (279,093.)

X.—Applications

Beatty. Nickel and nickel alloys. 27,954. Oct. 20.

British Thomson-Houston Co. Alloys. 28,041. Oct. 21. (U.S., 22.10.26.)

Coley. Distillation process for zinc oxides. 27,495. Oct. 17.

Hoyois. 27,621. See II.

Krupp A.-G. Raising yield point of steel alloys. 28,021. Oct. 21. (Ger., 7.12.26.)

Marks (Amer. Machine & Foundry Co.). Fusible alloy. 27,964. Oct. 20.

Norddeutsche Affinerie. Dearsenifying ores etc. 27,532. Oct. 17. (Ger., 3.3.27.)

O'Brien & Partners, Ltd., and Gower. Coating aluminium etc. 27,880. Oct. 20.

Ruben (Kahr). Distillation of zinc. 27,959. Oct. 20.

Smith. Treatment of ores etc. containing platinum. 28,035. Oct. 21.

Standard Telephones & Cables, Ltd. (Western Electric Co.). Electrodeposition of alloys. 27,760. Oct. 19.

X.—Complete Specifications

17,261 (1926). Jacobsen, Goffin, Goffin, and Renson. Recovering tin from tin-plate. (255,092.)

17,770 (1926). Ramen. Chlorinating ores. (255,475.)

1508 (1927). Buddeus. Reducing ores etc. (264,834.)

7536 (1927). Krupp A.-G. Sintered hard metal alloys and articles manufactured thereof. (278,955.)

XI.—Applications

Almeida Accumulators, Ltd., and Levy. Electric cells. 28,155—6. Oct. 22.

British Thomson-Houston Co., Ltd., Ward, and Warren. Insulating enamels, varnishes, etc. 28,139. Oct. 22.

Standard Telephones & Cables, Ltd. (Western Electric Co.). 27,760. See X.

XI.—Complete Specifications

24,129 (1926). Burger. Galvanic cell. (259,220.)

28,608 (1926). Hodgkiss and Smith. Batteries, accumulators, etc. (278,903.)

XII.—Applications

André. Treatment of oil seeds etc. 27,496. Oct. 17. (Fr., 15.10.26.)

Chesavon Fabrik. Cleansing-substances. 27,700. Oct. 18. (Ger., 19.10.26.)

Ellis (Amer. Sheet & Tin Plate Co.). 21,957—8. See II.

XII.—Complete Specifications

18,047 (1926). Simon, and Simon Bros. (Engineers), Ltd. Apparatus for distilling solvents in connexion with extraction of oils, fats, etc. (278,815.)

26,358 (1926). Savage. Extracting oleaginous and other materials with volatile solvents. (278,891.)

*27,496 (1927). André. Treatment of oil seeds etc. (279,122.)

XIII.—Applications

Allen & Sons, Ltd., and Butler. Luminous inks etc. 28,121. Oct. 22.

British Thomson-Houston Co., Ltd., Ward, and Warren. 28,139. See XI.

Du Pont de Nemours & Co. Coating-compositions. 27,965. Oct. 20. (U.S., 22.7.27.)

Gallie. Manufacturing and applying lacquer. 27,455. Oct. 17.

Hailwood, Naunton, Shepherdson, and Imperial Chemical Industries, Ltd. 28,089. See XIV.

Hart, Rodwell, and Roper. 27,773. See IX.

Menzen. Surface coatings. 27,494. Oct. 17.

XIII.—Complete Specifications

9623 (1926). Wilson, Thomas, and Scottish Dyes, Ltd. Production of colour bases for varnishes etc. (278,765.)

17,123 (1926). Klein and Brown. Manufacture of titanium pigments. (278,791.)

67 (1927). Craven, and Yorkshire Dyeware & Chem. Co. See XIV.

20,707 (1927). I.-G. Farbenind. Varnishes etc. (275,652.)

XIV.—Applications

Cogedex Comp. Gén. d'Exploitation. Utilising latex in making regenerated rubber. 27,633. Oct. 18. (Fr., 31.8.27.)

Hailwood, Naunton, Shepherdson, and Imperial Chemical Industries. Manufacture etc. of pigments for colouring rubber. 28,089. Oct. 21.

XIV.—Complete Specifications

67 (1927). Craven, and Yorkshire Dyeware & Chem. Co. Manufacture of solid resin from crude guttapercha and/or balata. (278,922.)

4643 (1927). Silesia, Verein Chem. Fabr. Accelerating vulcanisation. (270,644.)

XV.—Complete Specification

25,605 (1926). Ehrenreich. Tanning shark skins. (278,885.)

XVI.—Complete Specification

*27,050 (1927). Krause. Sterilising water etc. (279,085.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Australia*: Air compressors (343). *Belgium*: Cold storage refrigerating and sterilisation plant, hydraulic plant (349). *Brazil*: Sugar machinery (362). Black and galvanised sheets, non-ferrous metals, caustic soda, soda ash, industrial chemicals, linseed oil, paint and varnish (363). *British India*: Pharmaceutical products, patent medicines (344); Glass bottles, metallic capsules, collapsible lead tubes, sprinkler corks (345); Paper, glycerin for manufacture of nitro-glycerin, unsensitised, glazed photo paper for ferro-prussiate photography (Director-General, India Store Department, Branch

No. 10, Belvedere Road, Lambeth, S.E.1). *Syria*: Rubber goloshes (360).

The I.C.I. at the Public Works, Roads and Transport Exhibition

Imperial Chemical Industries, Ltd., is showing at this Exhibition on Stand No. 20, Main Hall, various products of its constituent companies, including:—Silicate of soda P. 84 specially prepared for hardening and water-proofing concrete; a block showing the remarkable hardening effect of silicate of soda on concrete; silicate of soda for silicate macadam roads; blocks prepared from silicate of soda and limestone only, showing resemblance to concrete; and special grade silicate of soda for prevention of plumbo solvency and iron corrosion of drinking water mains.

Other exhibits include soda ash and hydrated lime for water softening and the treatment of industrial waters, and samples of limestone of various sizes suitable for all purposes, such as concrete making, paths, etc. Chlorox, a disinfectant, steriliser and cleanser, is shown together with liquid chlorine; a demonstration showing the application of chlorine to water supplies will be given. There are Melanoid bituminous paints in various grades to suit the requirements of every industry; commercial explosives and accessories to meet all public works requirements; complete plants and accessories for electric welding, and electrodes suitable for all types of metals; Thermit welding for tramways, etc.; and pure metals and alloys, carbon free.

Crawshaw's chemical colander, the new apparatus designed for the removal of grease from all metals and mechanical parts will be demonstrated on application; this apparatus is also being shown at the International Commercial Motor Transport Exhibition at the Olympia. Artificial leather cloth, all types of gas mantles, and storm lanterns are also amongst the many products shown by Imperial Chemical Industries, whose stand will well repay a visit.

News from Advertisements

Chief chemist, also assistant chemists with knowledge of artificial silk viscose process required (p. vi).

An engineer assistant is required by the Director of the Chemical Research Laboratory, Teddington, Middlesex (p. vi).

The University of London announces particulars of the forthcoming Gow Lectures on the Colloid Chemistry of the Rubber Industry, which will be given by Dr. E. A. Hauser, of Frankfurt-on-Main (p. vi).

The Appointments Board of the Imperial College of Science and Technology announces particulars of the facilities it offers (p. vi).

Chemist, B.Sc., requires post (p. vi).

There are now 126 firms represented in our Buyers' Guide.

EDITORIAL

Formaldehyde and So On

WE spent a very pleasant evening over the first publication on Chemistry Research issued by the new branch of the Department of Scientific and Industrial Research. It was a leisure evening, and we have few of these, and so we did not hurry and did not feel ashamed to wander a little off the beaten track. The Chemistry Research Board put us in a good humour at once by writing "the Board thinks"; we confess that we are tired of hearing from so many Government Departments that the Board think, or publish, or issue, or some other equally ungrammatical statement. Our pleasure took the form of considering what duty we owe the Board, and we find we are requested to state that this first report, on the Production of Formaldehyde by Oxidation of Hydrocarbons, can be obtained from H.M. Stationery Office in many cities and towns in the Empire, and in Helsingfors, Berlin and Tokyo, at the price of one shilling and nine pence. An editor of a chemical journal ought to know something about so common a substance as formaldehyde; we therefore spent half an hour looking up the few books we possess at home which give any account of it. We were referred to its discovery by Hofmann, in 1868, and to its connexion with photosynthesis and to the experiments of Ingenhousz, of Baly, Heilbron, and others. Having come to the conclusion that we could now write a few notes about this substance without committing such an error as to describe it as a colourless liquid, or a weak acid, we turned again to the Report. Formaldehyde we judge to be one of those simple organic compounds destined to play an important part in chemical manufacture: it is not particularly stable, and its activity makes it useful in an immense number of actions. Methanol, or methyl alcohol, may be synthetically prepared at low cost: we understand that sodium formate may be prepared, also very cheaply, by treating caustic soda with carbon monoxide. The Chemical Research Board has attempted to make cheap formaldehyde, or else a cheap aqueous solution of it, by the oxidation of the simpler hydrocarbons present in many commercial gases. The price of formaldehyde was £130 a ton during the war, and this was subsequently reduced to about £40 a ton, but even this is excessive. Some day, we suppose, a method will be invented for making it at a cost of five or ten pounds a ton. It will then be available as a cheap germicide or disinfectant: the statement in the Report that "the disinfecting action of formaldehyde is irreversible, germs being rendered permanently innocuous," is, we think, true. But is not the statement equally true of the action of the gallows and many other germicides besides formaldehyde? The Report shows that the particular methods attempted were not successful;

nevertheless there are many other methods which will, perhaps, be more amenable to reason. While we were groping about for a phrase to put in lieu of the too well-known one about the fish in the sea, we remembered, rather vaguely, a passage in a favourite poem describing how the Cyclops fell in love with the nymph Galatea, and how she disappointed him. Well, for once we had a little leisure, so we fetched down our Theocritus and read the whole idyll through and found it very good indeed. We should like to quote many lines of it here, but it really has not much to do with formaldehyde. Then we remembered that at the Cannizzaro centenary last year we and a few others visited the very spot where the Cyclops saw the fair Galatea swimming about in the Mediterranean, and we turned up the Alembic Club reprint of Cannizzaro's paper of 1858, and then we remembered how delightful it was to see Syracuse and the fountain of Arethusa and we read how Divine Alpheus, "by secret sluice, stole underseas to meet his Arethuse." The same poet alludes again to the fountain Arethuse, and "thou honour'd flood, smooth-sliding Mincius, crown'd with vocal reeds." The result was that, having for once in a long while a little leisure, we spent a very pleasant evening reading about Syracuse and Hiero and Theron and Pindar, and we read an Olympian Ode or two, with some difficulty and the assistance of a translation, and had a real good time. And here we offer our thanks to Sir Richard Threlfall and Dr. F. E. Smith and Sir Robert Robertson and Prof. J. E. Thorpe and the Directors of Artillery and Research and all others. May they produce many other reports, and when these appear, may we have a vacant evening, a clear fire, and a clean hearth! We will forget the smoke, the wealth, the roar of London, and the bustling street, for still by the Sicilian shore, the murmur of the Muse is sweet! We have had a very delightful holiday; to-morrow we must think about X-rays and Canada, and indulge in no more erring from the path.

A Pound and a Half of Coal

We were once privileged to examine some rather valuable early nineteenth century cartoons and we still remember vividly the ludicrous expression depicted upon the faces of a group of London citizens apparently in the penultimate stage of suffocation, engendered by the noisome products of combustion of coal gas, applied for the first time for street lighting. If the cartoon presents but a slightly exaggerated historical fact we imagine that a Prof. Cobb would have had great difficulty in persuading the citizens of London, Manchester or Leeds that an increase in the amount of coal-carbonised was a forward step. In some ways we are more enlightened to-day, and Prof. Cobb finds that we readily turn with him and

gaze into the smokeless atmospheres of the future. But as we write in comfort before a fire of smokeless coal glowing with evident satisfaction in its radiating efficiency we realise that it will be a long time before the burning of raw coal in one place or another will be a thing of the distressing past, and it is therefore satisfactory to note that raw coal is daily being made to give more and more of its potential energy with the production of less smoke.

A large proportion of the raw coal used to-day is burned under steam boilers in factories or electrical power-generating stations. The lessons which are being learnt in the latter installations may well be applied in the former, where frequently the efficiency of coal utilisation is woefully low. The progress which is being made in steam raising in power-generating stations may be exemplified by the single fact that, in two decades, the amount of coal used for the generation of one kilowatt-hour unit of electricity has fallen from ten pounds to two pounds. In some of the larger central stations it is confidently expected that it will soon be possible to generate a unit of electricity for every pound and a half of coal consumed in the boiler installation. Thus it is that we are supplied with electrical power to-day at almost pre-war costs—and occasionally even lower than pre-war costs—in spite of the fact that labour, plant and fuel charges have risen considerably in the interim.

The high efficiencies which are attained in central station steam-raising installations follow an intensive study of the problems of coal burning, heat conservation and plant design. Steam boilers of high rating are fired with pulverised coal burning in a combustion chamber constructed with water-cooled walls. Radiation from the setting is cut down to a minimum and large amounts of heat formerly passing away with the combustion gases to the stack are used for pre-heating the air on its way to the combustion zone. The tendency to produce steam at very high pressures is growing, and with it comes a better utilisation of the steam in the turbine, whilst frequently it is possible to make use of the spent low-pressure steam for heating purposes. Stoker-fired furnaces are being brought up to efficiencies which compare favourably with those shown in plant fired with pulverised coal, but, unless we are making a fundamental mistake, the latter type of installation appears to possess an economic advantage in that very low grades of coal—and therefore very cheap coal—may be used without sensible diminution in efficiency.

The value of cheaper electrical power demands no elaborate discussion, but there is another matter which the progress in power generation is able to teach the chemical industry. It is possible to burn coal under steam boilers and obtain amounts of steam half as much again as compared with the average return in chemical works. To reproduce the favourable conditions of power stations within chemical works and to raise the efficiency of steam-raising from 60% to 90% is probably impracticable, all things considered, but a great improvement is indeed possible. Complete, rapid combustion, effective control by means of registering instruments and thorough heat conservation are all possible as a result of the activities of the fuel engineer who is eager to keep within his ken the smaller installation as well as the large central power generating station.

"IN CANADA WITH THE EMPIRE MINING AND METALLURGICAL CONGRESS"

By A DELEGATE FROM GREAT BRITAIN

(Continued)

From Hamilton the Congress passed on to Niagara Falls for an evening visit to this great wonder of nature, afterwards going underneath the Falls through the Scenic Tunnel. The aluminium works on the American side, though of metallurgical interest, are decidedly not an addition to the scenic attractions of the district. From Niagara Falls we proceeded by night to Port Colborne, on Lake Erie, where the Welland Canal débouches on its way across country to Lake Ontario. Here parties visited the great grain elevator, the flour mill of the Maple Leaf Milling Company (the largest in the British Empire), the blast-furnace of the Canadian Furnace Company, and the refinery of the International Nickel Company. The capacity of the Furnace plant is about 125,000 tons of pig-iron per annum.

The nickel plant refines Bessemerised copper-nickel matte produced at Copper Cliff, in the Sudbury district of Northern Ontario. The Port Colborne refinery is equipped with four blast-furnaces, with a capacity of 100,000 tons per annum for treating mattes, five converter stands with a capacity of 15,000 tons of copper per annum, eleven roasting furnaces, one Dwight-Lloyd sintering machine, and one anode furnace. Stack gases are treated in a Cottrell electric separator for the recovery of valuable fumes. The electrolytic copper refinery has a capacity of 6000 tons annually. The nickel refinery formerly used the Orford process, being equipped with four refining furnaces, and having an annual capacity of 24,000 tons. A new electrolytic nickel refinery, capacity 6000 tons, has recently been installed which provides also for the recovery of the precious metals present in the mattes. In addition to refined copper and nickel, there is a small production of nickel oxide and sulphate.

From Port Colborne we returned to Toronto, spending Saturday afternoon and evening at the Canadian National Exhibition, an annual fair held in grounds very much larger than those of Wembley, with a frontage on Lake Ontario, where a remarkable accumulation of automobiles from all over North America may be seen during the ten days the Exhibition is open. We saw quite a creditable exhibit from Great Britain, but the importance of this Exhibition in Canadian business is such that a very much larger representation of British manufacturers is to be desired in the interests of British trade with Canada.

After a quiet Sunday at Toronto, morning found the party at Sudbury, where we entrained for Copper Cliff to inspect the Creighton mine of the International Nickel Company, afterwards proceeding to the Inco smelter, from which the matte is despatched for refining to Port Colborne. During the afternoon of the same day we visited the smelter and acid plant of the Mond Nickel Company, the latter plant having been installed to collect and utilise the sulphur fumes. Since our visit, I understand, the Mond Company has lost its Worthington mine, the buildings and a large section of the railway track having subsided many hundreds of feet into the earth. This Company and the International together can take solace in the fact that the Frood mine, in which both have

interests, is reckoned to contain at a depth of 2300 ft. some 100,000,000 tons of ore, or sufficient to supply the world demand at the present rate for 75 years.

The treatment of the ore at the Inco smelter includes roasting, smelting in blast or reverberatory furnaces, and the enrichment of the furnace matte by blowing in basic converters. A portion of the ore is roasted in wedge roasting furnaces and charged to reverberatory furnaces, but most of it is roasted in the open-air in large heaps of 5000 tons of ore each, others loaded by steam shovels into railway cars *en route* to the smelting plant. Here, mixed with a certain proportion of unroasted ore, coke and flux, it is charged into blast furnaces, from which it issues in the form of slag, and a matte carrying 25 to 27% combined copper and nickel. The reverberatory charge also consists of both roasted and green ore and, in addition, flue dust. It yields a matte of about 16% in copper and nickel. Matte from both blast and reverberatory furnaces is charged molten, with quartz and mine rock as flux, into large, magnesite-lined Pierce-Smith converters. In these it is blown until the matte contains 79 or 80% copper-nickel and only 0.3 to 0.5% iron, the balance being sulphur.

At Coniston, the Mond Nickel Company, instead of heap-roasting the ore from its mines, sinters it on Dwight-Lloyd straight-line sintering machines, from which it is taken to blast furnaces, the resulting furnace matte being blown to high-grade converter matte in large Pierce-Smith basic converters. The blast furnaces handle raw ore, sintered ore, metal-bearing scrap, limestone and coke, each having a capacity of 400 to 500 tons of ore a day. The matte from the furnace runs into a settler to separate it from the slag, whence it is tapped into ladles of about 10 tons capacity, poured into the converters, each holding about 40 tons. Fine raw ore is also charged to the converters. Air blown through the molten mass oxidises the sulphur, which passes off as SO_2 into the acid plant. The iron, combining with the silica of silicious copper ores added as flux, goes off as a slag. The resulting converter matte, containing some 41% nickel and an equal amount of copper, 17% sulphur, and less than 1% of iron, is ladled into moulds to solidify, and thence shipped to Wales for refining.

The sulphuric acid plant, established in 1925, is capable of producing 25,000 tons of acid a year, and saves the Company many thousands of dollars in litigation with "fume farmers." Power for both mines, concentrators and smelters in the Sudbury district comes from hydro electric developments in the neighbourhood.

The next day was devoted to an examination of the silver mines and concentrating plants in the Cobalt-South Lorrain district, where the ores are of a complex character, containing not only silver, but also cobalt, arsenic, nickel, and some copper and bismuth. Ninety-seven per cent. of the silver occurs native. At the mills in the vicinity of Cobalt we saw the extraction of the metal by cyanidation, which has largely replaced the gravity washing process. Oil flotation is employed to treat very low-grade material, usually the tailings from other processes carrying from 3 to 5 ounces of silver to the ton. Residues are sent to the Deloro Smelting & Refining Company's plant at Deloro, Ont.

At the Kirkland Lake goldfield, visited the next day, we viewed underground workings at 2475 ft., and the

milling, oil flotation and cyanidation processes at the surface, proceeding after lunch to Timmins, the hub of the Porcupine district, to see on the following day the great Hollinger mine, which is straining every nerve to secure distinction as the world's greatest gold mine.

In the Kirkland Lake mills the practice is "all-sliming" cyanidation, followed by precipitation with zinc dust. The presence of tellurides in the ores has occasioned the introduction in one mill of a flotation machine into the ordinary cyanide circuit after the tube mills and classifiers. By means of this the tellurides are cut out of the pulp as a flotation concentrate, which is then treated with bromine and turned back into the circuit at the agitators. At one mine sodium peroxide is added to the pulp at the agitators for the same purpose. In the Porcupine mills the ores yield readily to cyanide treatment, and this, with supplementary amalgamation on two mines, is the general practice. The "all-sliming" method is adopted here also.

On the afternoon of the visit to the Porcupine gold field we who were booked for Tour "A," westward from Cochrane, bid farewell to the "Green" train conveying delegates taking Tour "B" eastward to the Rouyn coppermining district, to the Saguenay power and aluminium developments, and to the Sydney, Cape Breton, coal and steel industries, and thence to Newfoundland to visit the Bell Island iron ore mines. The "Blue" and "Red" trains proceeded westward at night to Hudson and Minaki, where some of our number embarked on flying boats for a trip to the gold mines and hydro-electric power station in Central Manitoba, joining us the next day at Winnipeg none the worse for their experience. The Central Manitoba Mines, Ltd., whose properties were visited by this party, are, it is understood, installing a mill for the cyanide treatment of the ore of the Kitchener mine, with a crushing capacity of 300 tons per day; the cyaniding plant will be able to deal with 150 tons daily. Power will be transmitted a distance of 43 miles from the Great Falls plant of the Manitoba Power Company, on the Winnipeg River, which has a total installation of 168,000 h.p., in six units of 28,000 h.p. each, four of which are now in operation, and supplying for the most part the City of Winnipeg and its immediate vicinity.

We spent, in the City of Winnipeg, two very interesting days, and on Monday, September 5, found ourselves breakfasting at Estevan, Saskatchewan, in the southern part of the province, 12 miles from the United States frontier. Here visits were paid to several of the lignite mines, in which operations are being carried on at comparatively shallow depth. The district is underlain by no less than 9,000,000,000 tons of coal, the principal defect of which is its extreme friability, making summer transport difficult. The Governments of Canada, with Manitoba and Saskatchewan, have together spent about \$1,000,000 in efforts to find a commercially practicable method of carbonising and briquetting this coal, but the plant which we visited in the course of the day has been abandoned for some time past. While we were there it was announced briefly that the plant had been disposed of to English capitalists, together with the Western Dominion colliery, and that a new process was to be tried out there.

(To be continued)

PLANT FOR THE DRYING OF COSSETTES IN THE DE VECCHIS PROCESS OF BEET SUGAR MANUFACTURE*

By G. W. RILEY, M.I.Chem.E.

It is proposed to deal with the pre-drying of the beet cossettes in some detail, as this forms such an important feature of the De Vecchis process.

George Scott & Son (London) Ltd.—becoming acquainted with the White Paper and learning of some of the difficulties experienced, approached Dr. De Vecchis early

FIG. 1

A description of one of the earlier designs of dryer used at Loreo will be found in the White Paper, Cmd. 2343 (1925), and it is generally known that considerable

difficulty arose in the working of this and the other types of dryers used in Italian factories. In 1926 with a view to putting forward a design based on their standard hand dryer. This design is shown in the perspective line illustration (Fig. 1 and photo-

FIG. 2

difficulty arose in the working of this and the other types of dryers used in Italian factories.

The firm with which one of the authors is concerned—

graphic reproduction (Fig. 2). These dryers are usually made steam-heated, but the general mechanical details and the method of re-circulation were considered to be specially applicable to the present problem.

Designs were accordingly prepared for a fire-heated

* Paper read at a joint meeting of the Chemical Engineering Group of the Glasgow Section at Glasgow on October 19, 1927.

dryer to deal with 70 tons of washed and sliced beet per 24 hrs., working with the limiting temperatures specified by Dr. De Vecchis and providing the coagulating conditions desired. This was erected and put to work at Sanguinetto for the 1926 campaign. Before describing the machine it is proposed to deal briefly with certain principles underlying the design of this type of dryer.

The removal of the moisture from the wet material is achieved by passing air through some form of heater and then through the dryer chamber, where the air parts

should also be approximately the same for all efficient types of dryers working under similar conditions as regards capacities, internal temperatures, etc., and making use of reasonably efficient methods of minimising radiation losses. The heat required to evaporate a given amount of water does not vary greatly with the temperature, while the heat in the dried material as discharged from the dryer is a constant factor when care is taken to ensure that the temperature of the dried product is brought to a constant figure. This last condition is a necessary corollary of the coagulating con-

FIG. 3

with some of its heat to the wet material, heating it and evaporating the moisture. Where it is permissible to pass the products of combustion through the dryer it is obviously more economical in fuel consumption compared with steam-heated plant, as all the boiler losses are eliminated. There is also a distinct advantage over indirect heating, as for practical reasons it is impossible completely to transfer all the heat in the furnace gases to the air or gas used in drying. Under good average conditions there should be little loss of heat by incomplete combustion in the furnaces, and the loss should be approximately the same for most types of furnaces in common use. The loss of heat by radiation

conditions specified by Dr. De Vecchis. The only other direction in which some of the original heat supplied is carried from the machine is in the air accompanying the water vapour discharged from the dryer. It is, therefore, convenient to consider the proportions of heat carried away in the water vapour and the discharged air when examining the thermal efficiency of any particular type of dryer using air or gas as a heat-carrying medium.

In this case it was considered desirable to limit the maximum temperature of the air or gas coming into contact with the wet beet to 100°–105° C., in order to obviate caramelisation or inversion of the sugar

content of the beet, and it is interesting to consider how best to obtain the highest heat efficiency under this limiting condition. Two alternatives are possible with fire-heated dryers in which the products of combustion pass through the drying chamber; the first, to dilute the furnace gases with atmospheric air—to give the limiting temperature—passing the mixture through the dryer chamber, and the second, to re-circulate the air through the chamber, expelling part as nearly saturated as possible at each circuit and re-heating the remainder to the limiting temperature by admixture of hot furnace gases before returning same to the drying chamber.

in connexion with this problem, as most psychrometric charts are concerned with lower temperatures than were contemplated in this case. The chart deals with unit weight of dry air and the weights of water vapour required to saturate or partly saturate it at the various temperatures. The abscissæ represent temperatures and the ordinates represent weights of water vapour. The 100% saturation line represents the weight of water vapour required to saturate unit weight of dry air, and the 90%, 80%, etc. curves represent percentage saturations at varying temperatures, the percentage saturation for the purpose of the chart being defined as the ratio

FIG. 4

ADVANTAGES OF RE-CIRCULATION

With the first alternative it is desirable to transfer as much heat as possible from the hot dry air to the water, but it is not possible to reduce the temperature of the resulting air-water vapour mixture below the saturation temperature. Actually it is not practical to reach this temperature, as intimate and prolonged contact would be necessary to arrive at this state of equilibrium. The psychrometric chart (Fig. 3) gives the weights of water vapour required to saturate unit weight of dry air at different temperatures and the weights of water vapour required to give various percentage saturations.

The psychrometric chart is extremely useful in studying these air dryer problems. Fig. 3 was especially prepared

of the weight of water vapour present per unit weight of dry air to the weight of water vapour required to saturate unit weight of dry air at the given temperature. Relative humidities are, of course, usually calculated on a unit volume basis, but this is not so convenient for the study of drying problems as percentage saturation. The nearly horizontal lines sloping down to the right are lines of constant heat or adiabatic lines. Fig. 4 shows another psychrometric chart drawn to a smaller scale, and which indicates the density, volume and total heat values in centigrade, kilogram, cubic metre units for saturated mixtures containing 1 kilogram of dry air. It will be observed from Fig. 3 that unit weight (kilo or pound) of *dry air* at an initial temperature of approximately 100° C., when brought into intimate contact

with water (at 15° C.) for a sufficient period of time, would become fully saturated at 30° C., the weight of water vapour being 0.027 units. It could also be 50% saturated at 39.5° C., the weight of water vapour being 0.0235 units.

From the psychrometric chart it will be noted that the weight of water vapour increases more rapidly than the heat content of the air portion of the mixture. The combined effect of these two factors is that the higher the temperature of the exhaust gases the greater the thermal efficiency of the drying. This is also true for other percentage saturations.

representing temperatures of air-water vapour mixture discharged from a dryer and give the results obtainable under our conditions with re-circulation of air through the dryer. In addition to the heat per unit weight evaporated and thermal efficiency, they show the heat required to evaporate water at given vapour discharge temperatures from water at 15° C. when no air or gas is present. It will be noted that this curve is almost a horizontal straight line. A study of these curves demonstrates clearly the advantage of a high temperature in the air-water vapour mixture, together with a high percentage of saturation.

FIG. 5

Drying by hot air

Figs. 5 and 5A.—Assumptions: Air enters heater saturated at 15° C.

Wet material enters dryer at 15° C.

Quantities of heat plotted per unit. Weight evaporation from wet material.

Percentage saturation of air-water vapour mixture — $\frac{\text{Weight water vapour mixed with unit weight dry air}}{\text{Weight water vapour required to saturate at same temperature}}$

If A = Heat in water vapour evaporated per unit weight evaporated above water at 15° C.

If B = Heat added to atmospheric air (saturated 15° C.) to evaporated unit weight of water.

Thermal efficiency = $\frac{A}{B} \times 100$; radiation and other losses neglected.

This is more clearly shown by a study of the curves in Figs. 5 and 5A. These all apply to the evaporation of unit weight of moisture starting with atmospheric air fully saturated at 15° C. and water also initially at 15° C. The curves in Fig. 5 are plotted with the abscissæ representing the temperature of the hot air entering the drying chamber, and correspond with the first alternative. They give the heat required per unit weight evaporated for 100%, 75%, and 50% saturated exhausts, the corresponding temperatures of the exhaust mixture and the thermal efficiency of drying as defined on the diagram. The curves in Fig. 5A on p. 1040 are all plotted with the abscissæ

Applying this data to the Sanguinetto dryer with a maximum air temperature of 100° C.

Without re-circulation

100% saturated exhaust gives exit temperature 34.5° C., heat required per unit weight evaporation	802 centigrade units.
75% saturated exhaust, exit temperature 39.5° C., heat required	800 centigrade units.
50% saturated exhaust, exit temperature 44.5° C., heat required	855 centigrade units.

With re-circulation, and with exit temperature 75° C.

100% saturated exhaust, heat required per unit weight evaporated	667 centigrade units.
75% saturated exhaust, heat required per unit weight evaporated	680 centigrade units.
50% saturated exhaust, heat required per unit weight evaporated	705 centigrade units.

To obtain a corresponding heat efficiency with a non-re-circulating dryer it would be necessary to have an initial temperature of 1100° C. in the air admitted to the dryer chamber with a 100% saturated exhaust at 75° C. or 800° C. and 530° C. with 75% and 50% saturated exhausts respectively.

TWO-COMPARTMENT DRYERS

The considerations set out above deal with a single compartment dryer, but will be correct for a two-compartment dryer so long as there is only one exit for the air-water vapour mixture. When re-circulating it is neces-

FIG. 5A
Drying by hot air

sary for a considerable amount of water vapour to be re-circulated with the atmospheric air, and this water vapour acts as a heat carrier equally with the air. By making suitable arrangements, it is possible to divide the drying chamber into two compartments with re-circulating and air-withdrawal arrangements in each, designed to maintain in circulation through one of the compartments an exceedingly dry atmosphere, exhausting this into the second dryer compartment circuit, the exhaust from the complete machine being from the second compartment. Differing maximum temperature conditions can also be maintained in each compartment if necessary. This is particularly convenient in the present case, as it is necessary to obtain a very dry product and to maintain the dry material for a specific period at a somewhat lower temperature than the maximum permissible in the other compartments where the greater part of the drying takes place. It is also an advantage

in other cases, since for a large number of materials it is necessary to control and maintain a lower temperature more carefully in the circulating air in contact with the nearly-dried material than is permissible with the moist material. Further, the last stages of drying are very frequently the most difficult, and a very dry atmosphere is of particular advantage.

How these differing conditions were provided for will be clear from a study of one of the flow diagrams shown in Fig. 6. These flow diagrams were prepared when first considering details of the design, in order to arrive at the most favourable working conditions and the volumes, etc. of air which would have to be circulated under certain conditions to give the desired results, and will be dealt with later, but, in the meantime, the small proportionate weight of water vapour in the mixture circulating in the lower drying chamber as compared with the mixture circulating in the upper chamber will be noted.

FUEL REQUIREMENTS

When estimating the fuel consumption per 100 tons of washed beet, an original moisture content of 77% and a final moisture content of 2% were assumed. This gives an evaporation of 76.53 tons and 23.47 tons as the weight of the dried cossettes. Assuming also a 50% air-water vapour mixture discharged from the dryer, a saturated external atmosphere of 15° C., a temperature of 15° C. in the wet beet, and the specific heat of dry beet 0.5, the heat required per 100 tons of wet beet is arrived at as follows:

Weight of water vapour required to saturate unit weight of dry air at 75° C.	0.3877 units
Weight of water per unit weight of air to give 60% saturation	0.3877 $\times \frac{40}{100}$ or 0.2322 units.
Weight of water to saturate unit weight of air at 15° C.	0.01047
Increase in moisture content unit weight air entering dryer saturated at 15° C. and leaving 60% saturated at 75° C.	0.2322 - 0.01047 units 0.2215 units.
Weight of dry air required to evaporate 76.53 tons water	$\frac{76.53}{0.2215}$ or 344.5 tons
Weight of water vapour entering dryer with air	$344.5 \times 0.01047 = 3.607$ tons.

For 100 tons wet beet

Heat required to evaporate water only	76.53×620.4 , or 48168 C. ton units.
Heat required to heat the dry air to exhaust temperature	$344.5 \times (75 - 15)$ > 0.2375 , or 4900
Heat required to heat up water vapour in the air	$3.607 \times (75 - 15)$ > 0.48 , or 104
Heat added to dry matter in beet	$23 \times (90 - 15) \times 0.5$ 862.5
Heat added to water in dried beet	$0.47 \times (90 - 15) = 135.3$

Total	51078.8
Allowing 10% heat loss on total used for radiation losses, incomplete combustion, unconsumed ash, etc.	0008.7
	00087.5

Or, say, 8 tons of fuel having a calorific value of 7500 centigrade pound units, or 13,500 B.Th.U. and a total heat consumption per ton of washed beet of 600 centigrade ton units, or 1,344,000 centigrade pound units, or 2,419,200 B.Th.U. This corresponds with 9.56 pounds of evaporation per pound of coal.

It will be of interest to compare this estimate of fuel consumption with results recently obtained at Sangi-netto. This season it was decided to use oil fuel, and with this it is particularly easy to measure fuel consumptions. The early results of complete day runs gave

fuel consumptions varying from 4.9 tons of fuel oil to 6 tons per 100 tons of washed beet, the oil having a heating value of 10,500 calories (18,900 B.Th.U.). This corresponds with 6.86 to 8.4 tons of 7500 calories (13,500 B.Th.U.) fuel per 100 tons. With more experience the operators will undoubtedly reduce the fuel consumption regularly to the lower figure, or do

give completely satisfactory results. Last season at Sanguinetto coke and "Rubbli Kuhl" breeze were used, giving quite good results as regards fuel economy and good quality cosettes. The Italian furnaces used were not well suited for this small fuel, but even so, fuel consumptions of 8 tons and less per 100 tons of washed beet were obtained over complete day runs.

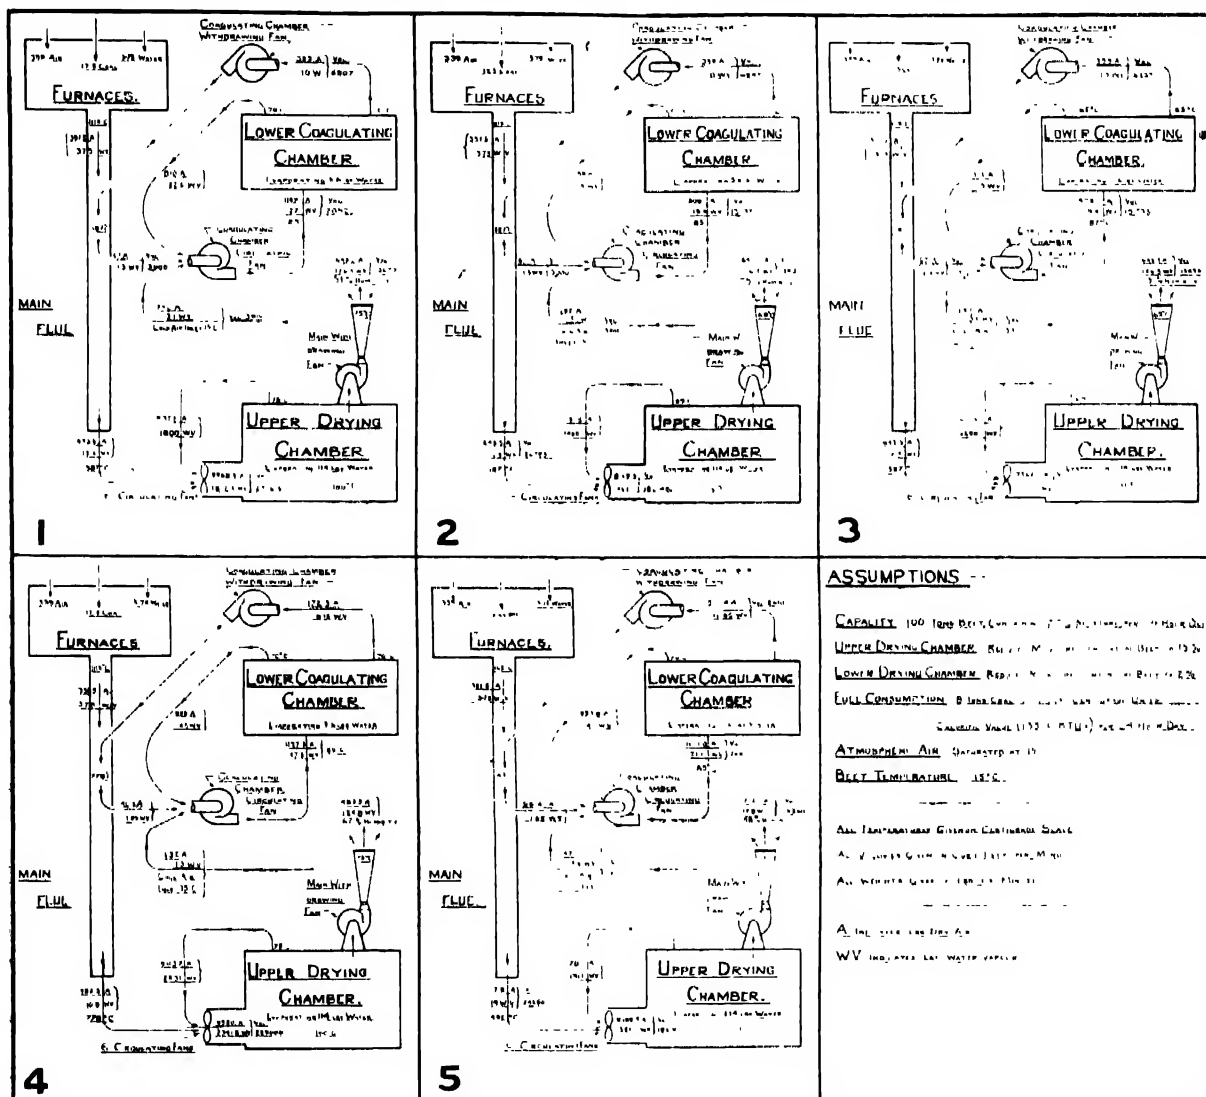

Fig. 6

Air circulation diagrams

even better. There is no reason why equivalent results should not be obtainable with solid fuel. Italy, of course, has to import all its fuel, and oil therefore is in rather a favoured position, but in this country solid fuel would give cheaper running costs.

Bearing in mind that a high CO_2 content in the furnace gases is not necessary with these dryers, it should be possible to make certain of complete combustion, and it is considered possible that cheap bituminous coal, with or without coke smalls or small anthracite fuel, would

HEAT AND AIR FLOW

To arrive at the most desirable conditions as to volumes of air circulated etc. a number of flow diagrams (some of which are shown in Fig. 6) were prepared. These diagrams also illustrate the flow of furnace gases through the machine. The wet beet first enters the upper drying chamber, passing through this on travelling bands before being discharged into the lower drying and coagulating chamber, but for convenience the upper drying chamber is shown below the coagulating chamber, whereas in

actual practice it comes above. The hot furnace gases travel through the main flue extending the full length of the dryer. The drying air is circulated through the lower drying chambers and its flues by the centrifugal fan indicated. A supply of hot furnace gases and atmospheric air continuously mix with the circulating air, and a portion of the circulating air (after passing through the partially dried cossettes entering this chamber) is withdrawn through the coagulating chamber by the fan and delivered back into the main flue, thus reducing the temperature of the flue gases.

The circulation through the upper drying chamber is maintained by a series of large propeller fans coupled together and arranged along the full length of the drying chamber. The furnace gases enter the circuit through regulated openings in the main flue and restore the temperature of the drying gases to the predetermined maximum just before these gases come into contact with the beet. A portion of the more saturated air is withdrawn by the main withdrawing fan from the circuit after

of all the conditions led the engineers to expect an average temperature drop of approximately 30° C. Again, it is not possible to obtain a fully saturated air discharge without unduly increasing the time of contact of air mixture and cossettes, thus making the equipment excessively large. A temperature of approximately 70° C. and a percentage saturation of approximately 60% were accordingly legislated for, and means provided to vary slightly the position over the top band through which the exhaust gases were discharged from the plant. In this connexion it will be of interest to record that tests recently made of the temperature in the beet leaving the top chamber gave a reading of 76° C.

1926 DRYER

Seventy tons per 24 hrs was decided upon as the maximum safe duty for a single unit dryer in the first place, the principal deciding factors being the weight and strength of the drying band chains and the length of machine necessary to provide circulating area for the

FIG. 6A

passing through a selected area of the top travelling band, on which rests the wettest beet, and is discharged from the machine.

Temperatures are indicated at different points of the circuit and weights of dry air and moisture in circulation, together with volumes at certain critical points. The very large volumes of air-water vapour mixture that have to be circulated will be noted, and it is interesting to compare the volumes with those provided for in the Loreo dryer described in the White Paper. In that case, for 5 tons of wet beet per hour a circulation of 18,000 cb. ft. per min. was provided, against from 163,000 to 240,000 cb. ft. per min. called for in the hypothetical cases set out in the diagram for 4-16 ton of beet per hour. Actually in the 100-ton "Scott" machine provision was made for the circulation of larger volumes than are indicated in the diagrams.

It will be clear that the actual amounts circulated depend upon the average temperature drop of the air mixture in each circuit, and that this temperature drop would vary along the machine. A careful consideration

air etc. This equipment was designed and the parts shipped last year despite the interference of the General Strike. As a result of that strike, however, it was not found possible to experiment with the drying of beet with air of the temperatures and humidities contemplated, although a small stationary dryer was made for the purpose. It was not, therefore, possible to confirm or check some of the assumptions made.

This machine was provided with three endless drying bands in the top chamber and two endless bands in the bottom or coagulating chamber, and was heated by means of five hand-fired furnaces working under balanced draught burning small coke and "Rubbli Kulm." This mixed fuel had a high dust content. The hand-fired furnaces were provided by the Italian factory, and the type was decided upon by the customers as likely to provide the most satisfactory commercial results in view of the comparatively low cost of Italian labour.

Provision was made for 15 different periods of drying, the total times for drying and coagulating varying from 2 to 3½ hrs.

(To be continued)

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

SUSPENSION OF ENTRANCE FEE

The Council has decided to continue the suspension of the Entrance Fee during the year 1928.

ABSTRACTS IN APPLIED CHEMISTRY

It has been arranged to supply members of the Society with reprints of the Abstracts of Applied Chemistry, printed on one side of the paper only, at the price of £1 for the year 1928.

Applications for these, accompanied by the appropriate remittance, should reach the General Secretary before the end of the present year.

LONDON SECTION

The meeting on November 7 was devoted to a consideration of "Recent advances in the hydrogenation of oils."

In a "General introduction" Mr. E. R. Bolton reviewed briefly the early history of hydrogenation, and compared the older methods employing powder catalysts with a new continuous process using a fixed catalyst, which is regenerated repeatedly without loss, and which may therefore be described as constituting "part of the plant." Oil was hydrogenated in laboratory apparatus to demonstrate the principle of continuous hydrogenation by a fixed catalyst, and the construction and operation of commercial plant was illustrated by lantern slides. The advantages of the continuous hydrogenation process—such as the avoidance of the necessity for filtration of hydrogenated oil—were emphasised, and data given showing the ease of control of the degree of hydrogenation. The composition of oils hydrogenated by different processes was discussed, and it was shown how composition could be altered at will by varying the methods of operating the continuous process.

In the next paper "Selective hydrogenation" was discussed by Mr. K. A. Williams, B.Sc., who described a method by which the extent of the selective effect in the hydrogenation of oils may be measured. The method is applied to the hydrogenation of a number of oils under varying conditions. It was shown that the degree to which the reaction is selective is inversely proportional to the iodine value of the oil treated, and, for a particular oil, directly proportional to the temperature of reaction. With fatty acids the selective effect is directly proportional to the iodine value of the original material.

In a further paper, on the "Melting point of hydrogenated oils," Mr. Williams gave the results of measure-

ments of the melting points of cottonseed oil hydrogenated, under varying conditions, to different extents. A relation was deduced between the melting point of the hardened product, the temperature of hydrogenation, and the corresponding extent of selection in the reaction.

The "Hydrogenation of fatty acids and neutral oils" was dealt with by Mr. R. G. Pelly, F.I.C. On hydrogenating whale oil containing 12% of free fatty acids, it was found that the fatty acids were hydrogenated more fully than the natural oil. Further investigation of this point by the hydrogenation of neutral oils and fatty acids and of known mixtures by means of (a) activated nickel turnings, (b) nickel carbonate-kieselguhr catalyst, has shown that (1) the rate of hydrogenation of fatty acids alone is less than that of neutral oil alone; (2) when a mixture of fatty acids and neutral oil is hydrogenated, the rate of hydrogenation of neutral oil is greatly retarded and that of the fatty acids is increased, in some cases beyond the rate for neutral oil alone; (3) the rate of hydrogenation of neutral glycerides is retarded even by saturated fatty acids. The COOH group in the free fatty acid molecule appears to be the important factor in this problem, but further investigation is needed.

The last paper, on "The activity of a nickel catalyst," was by Mr. E. J. Lush, M.A. It was shown that, in the hydrogenation of naphthalene, tetralin is formed exclusively when the naphthalene is passed over the catalyst in the vapour phase. In the liquid phase decalin is formed, and curves were given showing the influence of temperature and pressure of the hydrogen on the amount of decalin formed. The total hydrogen absorbed under standard conditions of temperature and pressure is independent of the relative proportions of tetralin and decalin produced. This observation is similar to that made in the hydrogenation of mixtures of linolein and olein, and evidence is produced from the hydrogenation of acetone, naphthalene, and vegetable oils to show that the weight of hydrogen added for a given weight of catalyst under standard conditions is independent of the substance being hydrogenated.

MANCHESTER SECTION

A joint meeting of the Manchester Sections of the Society of Dyers and Colourists, the Society of Chemical Industry, the Institute of Chemistry, and the Manchester Literary and Philosophical Society was held on November 4. Dr. H. Levinstein, President of the Society of Dyers and Colourists, presided, and was received with most hearty expressions of good wishes for his complete recovery from his recent illness.

An address entitled "Some new principles in chemotherapy," by Prof. A. G. Green, F.R.S., and Myer Coplans, M.D., was read by Prof. Green. The authors stated that the chemotherapy of dyestuffs and allied synthetic organic substances, based largely upon the views of Ehrlich, had on the whole been disappointing, owing to the chemical alteration of the drug under the influence of living matter. Such progress as had been made in therapeutic research had been mainly empirical, since we were at present unable to predict what specific chemical groupings would give to a drug a preferential affinity for invading organisms rather than for the protective cells of the body.

The authors had examined the question whether it might not be possible to exert a controlled and selective action upon foreign organisms and their toxins by the administration of compounds (derivatives of dyestuffs in particular) which were themselves inactive and innocuous, but which could be converted in the body or particular parts of it into active agents.

Two classes of compounds which might fulfil these conditions had been examined. A.- Leuco compounds which could give rise to physiologically active dyestuffs upon oxidation. B.- Special dyestuffs (or leuco-dyes) containing "labile acidic" groups, such as the "sulphate" group— $\text{NH}\cdot\text{C}_6\text{H}_4\cdot\text{OSO}_3\text{H}$ —or the omega-sulphonic group— $\text{NH}\cdot\text{CH}_2\cdot\text{SO}_3\text{H}$. From the authors' investigations the following conclusions were derived.

1. Leuco-dyes of the triphenylmethane class had a much smaller toxicity and bactericidal activity than the corresponding dyestuffs. When administered to animals they were excreted both by the liver and kidney if acidic or by the liver alone if basic.

2. Leuco-dyes of the triphenylmethane class exhibited a very remarkable neutralising or detoxicating action upon toxins such as those of diphtheria, tetanus, and cobra venom. In the case of the first two a very definite quantitative relationship could be proved to exist which varied with the toxin and the leuco-dye. It was believed that further investigation of this action might afford a basis for the local treatment of diphtheria and tetanus.

3. Sulphate dyes and sulphate leuco-dyes had in the unaltered condition but little toxic action and little or no bactericidal power. When, however, those substances were administered to animals they were excreted both by the kidneys and liver, and rendered the urine and bile strongly antiseptic.

4. Rabbits which had been artificially infected with an active strain of *B. typhosus*, and had thus become "typhoid carriers," were completely sterilised by continued administration of sulphate compounds.

5. Experiments made with mice infected with *Trypanosoma equiperdum* indicated the possibility of employing omega-sulphonic acids of active substances for blood sterilisation.

The results obtained would seem to indicate the possibility of new methods of attack in the treatment of disease, in which substances having little or no toxicity or physiological activity in themselves might be administered with the object of gradually liberating in the system definite drugs having a destructive effect upon invading organisms.

The paper was followed by a prolonged discussion.

MONTREAL SECTION

The first meeting of the session was held at the Windsor Hotel on October 19, preceded by the usual dinner. The chairman, Dr. J. F. Snell, presided, and about 70 members and guests were present.

Prof. Clark S. Robinson, of the Massachusetts Institute of Technology, delivered a very interesting address on "The theory and practice of industrial distillation and filtration." Prof. Robinson showed how the art of distillation was perfected long before the theory was seriously studied, and how, even to-day, empiricism still holds sway. He then discussed the function of the

fractionating column, and showed the importance of the reflux ratio and its relation to the amount of heat required, and hence to the cost of operation. After touching on the methods in use for calculating the diameter of the column and the number of plates, Prof. Robinson described a new graphical method, developed within the last two years, of computing the number of plates required. He stressed the importance, in those cases which are complicated because of the number of substances to be separated, of reasoning by analogy from the effects obtained with binary mixtures, and showed how difficult problems may be simplified by this method. In conclusion, he made a number of generalisations applicable to all problems of distillation and fractionation.

A very keen discussion followed the lecture, in which Dr. H. Hubbert, Dr. G. S. Whitby, Dr. F. W. Skirrow, and Messrs. J. A. Wales, J. N. Stephenson, H. Wyatt Johnston, and others took part.

OTTAWA SECTION

The opening meeting of the session was held at the University Club. Dr. F. T. Shutt presided, and was supported by a large gathering.

Mr. R. D. Whitmore, the secretary, read a paper, "The Society of Chemical Industry in Ottawa: An historical note." The Canadian Section of the S.C.I. was established in 1902 through the efforts of members of the Society in Toronto, Montreal and Ottawa. Most of the meetings in the earlier days were held in Toronto and Montreal, though the first Ottawa meeting was in 1904, at which papers were read and the aims of the Canadian Section were explained. However, at that time there was not a large number of chemists in Ottawa, and the formation of a branch in the capital was deferred until 1917. It acted through the Canadian Section until re-organised less than three years later as an independent Section. It is now one of the strongest and most vigorous of the Sections in Canada, and from the first has continued to be successful in promoting the welfare of both the full and the associate members, in providing a common meeting ground for chemists of the capital, and it also claims credit for further activities of a wider and more national character.

The chairman, Dr. Shutt, delivered his inaugural address, "A chemical study of a new system of grass land management for increased protein production." Some 27 years previously, with Dr. Fletcher, he had shown that young grasses had a higher nitrogen (protein) content than the more mature plants. Grasses, particularly as hay, are regarded as "low protein concentrates" so that if consumed when young they are much more valuable as food. In Germany, during the war, this knowledge was used in experimental work at Hohenheim by close grazing some 70 acres a small plot at a time. It was found that in three successive years they had reduced the pasture area per cow to one third of what had previously been necessary. Later, and more elaborate experiments were successfully made in Britain. In the experiments conducted at the Experimental Farm, Ottawa, a pasture which was growing meadow fox-tail was divided into four equal plots and A was cut weekly, B every 2 weeks, C at 3-week intervals, and D as hay

(before it seeded out) and subsequently the aftermath was cut. The cuts were weighed and analysed and the results tabulated in four charts. The charts showed that (1) the total weight of dry matter rose from A to D; (2) A had consistently the highest protein content (about 22%); (3) that the average protein content was from high to low in the order A, B, C, D, and that the reverse was true for the fibre content, and (4) that C showed the highest total weight of digestible matter, and that A, B, and C were all higher than D in digestible protein as calculated from the digestion coefficients established at Cambridge in some similar work. The great difference between the work recounted and that of the German and English trials was that whereas the two latter had heavily fertilised the land, no manuring was done in this work. The work is proceeding and other factors will be introduced.

SOUTH WALES SECTION

A meeting was held jointly with the local Section of the Institute of Chemistry at Thomas's Café, Swansea, on October 24, when a paper on "Hormones" was read by Mr. D. H. Hey, B.Sc. The chair was occupied by Mr. C. M. W. Grieb.

The lecturer described the better-known ductless glands, and their uses in the body, special attention being paid to the suprarenal, thyroid and pituitary. The hormones secreted by these bodies were dealt with, and their functions described. It was pointed out that they not only act as activating agents, but that some have important inhibiting effects, and the feminising of male organisms was explained in this connexion. The far-reaching effects of abnormalities in the functioning of the ductless glands were cited, and slides were shown dealing with cretinism, goitre, myxædema, acromegaly, gigantism, etc. Slides were also shown to illustrate sections of the thyroid gland in man and other animals, both in the normal and abnormal conditions. Cases were cited of experimental work on the removal of glands and on subsequent grafting: also on the injection and oral administration of gland extracts. The chemical nature of the few hormones of known constitution was dealt with, and the synthesis of thyroxine by Dr. Harrington was described. An account was given of recent work on insulin, and it was stated that as yet we could not claim to have isolated as a pure chemical entity the active constituent associated with the physiological activities of insulin. The rôle of sulphur and of nickel and cobalt in insulin preparations was discussed. A brief summary of the immense possibilities of further work in this field was given, and the paper concluded with a general reference to the ideal attitude of scientific research to life. It was pointed out that there was just a possibility that one day in our thirst for knowledge we might find ourselves possessing powers which we have no wish to possess, but that if we can direct our progress along such lines as will lead to a better understanding of life, to the alleviation of human suffering, and perhaps to a control over those unhealthy conditions of mind which lead to crime and immorality, humanity would be the richer.

An interesting discussion followed, in which Prof. Coates, Dr. A. G. Ramsay, Dr. MacNair, Mr. Ayling, and the Chairman took part.

CALENDAR OF FORTHCOMING EVENTS

Nov. 14.—**University of London, University College, Gower Street, W.C.1, at 5.15 p.m.** The Gow Lectures on "The colloid chemistry of the rubber industry," by Dr. E. A. Hauser. Prof. F. G. Donnan, C.B.E., will preside. (Also on November 16 and 18.)

Nov. 14.—**Institute of Metals, Scottish Local Section, Rooms of the Institution of Engineers and Shipbuilders, 39, Elmbank Crescent, Glasgow, at 7.30 p.m.** "Brass foundry practice," by A. Logan.

Nov. 14.—**Institute of Brewing, London Section, Charing Cross Hotel, Strand, W.C.2, at 7.45 p.m.** "Modern malt kilns," by Dr. A. Fernbach.

Nov. 14.—**Royal Society of Arts, John Street, Adelphi, W.C.2, at 8 p.m.** *Cantor Lecture 1.* "Alloy steels: their manufacture, properties and uses," by Prof. H. C. H. Carpenter. (Also on November 21 and 28.)

Nov. 14.—**Ceramic Society, North Staffordshire Technical College, Stoke-on-Trent, at 7.30 p.m.** "Electrical pottery firing—some notes on the Moore and Campbell electric enamel tunnel kiln," by B. J. Moore and A. J. Campbell. "Utilisation of waste heat for steam raising," by Dr. G. Martin.

Nov. 15.—**Armourers and Brasiers Company, Royal School of Mines, South Kensington, S.W., at 5.15 p.m.** "X-rays and metals," by G. Shearer. (Also on November 22.)

Nov. 15.—**Hull Chemical and Engineering Society, Hull Photographic Society's Rooms, Grey Street, Park Street, Hull, at 7.45 p.m.** "The ramifications of the oil industry," Part II. "Plant," by T. Andrews.

Nov. 16.—**Institute of Chemistry, London and South-Eastern Counties Section. Annual General Meeting, 30, Russell Square, W.C.1, at 8 p.m.**

Nov. 17.—**Institute of Metals, Birmingham Local Section, Engineers' Club, Waterloo Street, Birmingham, at 7 p.m.** Open discussion on "Annealing." (Arranged by the Co-ordinating Committee.)

Nov. 17.—**Society of Chemical Industry and Institute of Chemistry, Edinburgh and East of Scotland Sections, The Pharmaceutical Hall, 36, York Place, Edinburgh, at 7.15 p.m.** "Chemical formulae of long ago," by Prof. R. M. Caven.

Nov. 17 and 18.—**Society of Chemical Industry, Liverpool Section. Committee of Associated Learned Societies of Liverpool and District has arranged for exhibitions of scientific and educational films in the large hall of the David Lewis Club, Great George Street, Liverpool, at 7.30 p.m.**

Nov. 17.—**Institution of Mining and Metallurgy, General Meeting.**

Nov. 17.—**Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m.** *Ordinary Scientific Meeting.* (1) "Differential potentiometric titration. Part I. Simple method. Part II. Refined method," by B. Cavanagh. (2) "A general method for the preparation of carbocyanine dyes," by Miss F. M. Hamer.

Nov. 18.—**Society of Chemical Industry, Chemical Engineering Group, Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m.** "Some modern methods of recovery of lubricating oils," by A. J. Broughall.

Nov. 24.—**Society of Chemical Industry, Birmingham and Midland Section, The Chamber of Commerce Buildings, Birmingham.** "Notes on the chemistry and physics of stone decay," by A. R. Warnes.

INSTITUTION OF CHEMICAL

Below is a list of those present at the Annual Reception held at the New Prince's Galleries on November 2, supplementary to the list published in the issue for November 4:—The Lord Shaw of Dunfermline and the Hon. Mrs. Vaughan Thompson, the Lady Lockyer, the Lady Phyllis Allan, Mr. Alistair and Lady Diana Gibb, Mr. J. Arthur Reavell (Vice-President of the Institution), Mr. W. A. S. Calder (Vice-President of the Institution) and Mrs. Calder, Mr. E. H. Rogers (Honorary Treasurer) and Mrs. Rogers, Mr. and Mrs. H. J. Pooley, Mr. and Mrs. R. T. Campbell Finlayson, Mr. and Mrs. S. G. M. Ure, Mr. and Mrs. James MacGregor, Mr. and Mrs. William Macnab, Mr. and Mrs. P. Parrish, Dr. and Mrs. E. W. Smith, Mr. and Mrs. H. Talbot, Mr. R. G. Browning, Mr. and Mrs. J. H. Aiken, Mr. and Mrs. A. Allen, Mr. T. H. Bailey, Mr. Arthur Baker, Dr. J. H. Bankes, Mr. and Mrs. C. Barber, Mr. H. E. C. Bennett, Mr. and Mrs. W. H. Bennett, Mrs. Church Bliss, Mr. and Mrs. R. R. Byrne, Mr. and Mrs. E. P. Carter, Mr. and Mrs. A. Chaston Chapman, Mr. W. H. Coleman, Dr. H. G. Colman, Mr. F. C. Cooke, Lieut.-Col. F. A. Cortez-Leigh and Mrs. Cortez-Leigh, Mr. H. W. Cremer, Col. R. E. Crompton, Mr. P. B. Crossley, Prof. C. R. Darling, Dr. and Mrs. F. B. Dehn, Prof. and Mrs. S. M. Dixon, Mr. and Mrs. A. A. Drummond, Dr. A. E. Dunstan, Mr. R. Edgeworth-Johnstone, Mr. Edgar C. Evans, Mr. and Mrs. E. V. Evans, Dr. Margaret Fishenden, Mr. G. H. Ford, Prof. and Mrs. A. Fowler, Mr. and Mrs. P. C. Gardiner, Mr. and Mrs. W. J. Gee, Mr. and Mrs. W. D. Graddon, Mr. George Gray, Mr. and Mrs. H. E. J. Green, Mr. W. C. Hancock, Mr. F. W. Harbord, Mr. T. Shirley Hawkins, Mr. and Mrs. W. Hawkyard, Mr. Noel Heaton, Dr. H. S. Hele-Shaw, Dr. T. A. Henry, Mr. A. F. Hogg (Principal, Woolwich Polytechnic), Prof. B. W. Holman, Mr. and Mrs. A. V. Hussey, Mr. and Mrs. D. N. Jackman, Dr. and Mrs. L. A. Jordan, Mr. and Mrs. J. Kewley, Mr. Clifford A. King, Dr. J. G. King, Mr. and Mrs. C. A. Klein, Prof. H. Klugh, Dr. L. H. Lampitt, Dr. and Mrs. C. H. Lander, Mr. and Mrs. L. A. Legros, Dr. and Mrs. R. Lessing, Mr. J. Macleod, Mr. and Mrs. R. M. Macnaught, Dr. E. W. Maddison, Mr. and Mrs. R. J. Marx, Dr. P. May, Prof. and Mrs. W. H. Merrett, Dr. and Mrs. S. Miall, Mr. and Mrs. T. Miller-Jones, Mr. and Mrs. J. E. Montgomery, Dr. and Mrs. G. T. Moody, Dr. Burrows Moore, Mr. W. M. Mordey, Mr. E. W. Moss, Mr. and Mrs. A. E. Munby, Mr. F. H. Newman, Dr. D. M. Newitt, Prof. and Mrs. W. L. Odell, Lieut.-Col. W. A. J. O'Meara, Dr. and Mrs. W. R. Ormandy, Prof. and Mrs. S. G. Paine, Mr. and Mrs. R. G. Parker, Mr. George Patchin (Principal, Sir John Cass Technical Institute), Rear-Adml. and Mrs. A. D. Pound, Mr. and Mrs. L. Guy Radcliffe, Mr. and Mrs. William Reavell, Mr. and Mrs. G. A. Renton, Mr. H. T. F. Rhodes, Prof. K. Rice-Oxley, Mr. D. E. Roberts, Mr. J. F. Ronca, Dr. and Mrs. W. Rosenhain, Mr. and Mrs. C. E. Sage, Prof. and Mrs. S. B. Schryver, Prof. F. M. Simpson, Mr. and Mrs. F. S. Sinnatt, Dr. S. Skinner, Mr. and Mrs. J. F. Smellie, Mr. and Mrs. C. C. Smith, Mr. H. C. Smith, Mr. C. P.

Sparks, Mr. H. M. Spiers, Mr. L. Summer, Mr. and Mrs. F. Colin Sutton, Mr. W. A. Tait, Mr. J. Terrace, Dr. F. B. Thole, Prof. and Mrs. J. F. Thorpe, Mr. H. B. Toy, Dr. and Mrs. F. R. Tunks, Prof. T. Turner, Mr. W. G. Turner, Mr. A. J. V. Underwood, Mr. S. E. Watts, Mr. and Mrs. J. C. White, Mr. J. A. Wickham, Mr. Basil Wilson, Mr. M. F. G. Wilson, Dr. C. R. Young.

Recent Elections

Members

Carr, Francis H., C.B.E., F.I.C., Chief Technical Director, British Drug Houses, Ltd.
 Hatfield, W. H., D.Met., F.Inst.P., M.I.Mech.E., Director of the Brown-Firth Research Laboratories.
 Hazeldon, J. N., B.Sc., A.I.C., Chief Technologist, Coal Oil Extraction, Ltd.
 Heastie, B., A.M.Inst.C.E., Chief Technical Engineer, Kestner Evaporator & Engineering Co., Ltd.
 Holman, B. W., A.R.S.M., Assistant Professor of Mining, Royal School of Mines.
 Meredith, D. O., General Superintendent, Electrolytic Zinc Co. of Australasia, Ltd.
 Murphy, R. K., Chem.E., Dr. Ing., Lecturer-in-Charge of Chemistry and Head of Science Department, Sydney Technical College.
 Myers, E. M., General Manager, By-Products, Coke Oven Works & Washeries, Bolckow Vaughan & Co., Ltd.
 Roy, H. L., A.B., D.Eng., Professor of Chemical Engineering, Bengal Technical Institute.

Associate-Members

Graddon, W. D., B.Sc., Technical Managing Director, Vitalite Co., Ltd.
 Hussey, A. V., O.B.E., A.C.G.I., A.I.C., Works Manager, Lafarge Aluminous Cement Co., Ltd.
 Reid, A. T., B.Eng., Research Engineer, Hardie Rubber Works and Asbestos Slab & Sheet Manufacturing Co., Sydney.
 Stokes, A. H. J., A.M.I.Mech.E., Managing Director, Trade Grinding, Ltd.
 Taylor, C. B., B.Sc., A.R.C.Sc., A.I.C.
 Thyne, C. A. MacIntosh, Technical Assistant, Provan Gas Works, Glasgow.

Graduates

Deanesly, R. M., B.Sc., Shell Co., California.
 Rowden, E., B.Sc. (Hons.), A.R.C.Sc., D.I.C., Assistant with John Brown & Co., Ltd., Sheffield.
 Venkajee, T., B.A., Chemist and Works Supervisor, Carnatic Paper Mills, Rajahmundry.

Student

Klein, E., Student at the University of the Witwatersrand.

CHEMICAL SOCIETY

At a meeting held on November 3, Sir J. J. Thomson, O.M., F.R.S., was unanimously elected an Honorary Fellow. The President, Prof. H. B. Baker, C.B.E., F.R.S., announced that Professors C. S. Gibson, J. T. Hewitt, G. T. Morgan, and J. F. Thorpe had been reappointed to represent the Society on the Bureau of Chemical Abstracts, and that Professors A. J. Allmand and F. G. Donnan and Dr. T. Slater Price would represent the Society on the Editorial Board of the Journal of Physical Chemistry, together with Dr. E. K. Rideal, appointed by the Faraday Society. It was also announced that Prof. W. A. Bone's lecture on "Gaseous combustion at high pressures" would be delivered at the Society's

rooms on November 24, at 8 p.m., and that applications for grants from the Research Fund must be made on or before December 1.

Dr. F. G. Mann described :—

The complex salts of nickel with various aliphatic diamines.

ATTEMPTS have been made to obtain more decisive evidence for the configuration of the tetrammino-nickelous complex by co-ordinating nickel with diamines, producing the compounds

If the nickel complex has the uniplanar configuration, all these salts should exhibit *cis-trans* isomerism; if the complex has the tetrahedral configuration, they should be resolvable into optically active forms. Actually, no trace of *cis-trans* isomerism could be detected, whilst all attempts to resolve the first, fourth, and fifth salts failed.

Although bivalent nickel can show a co-ordination number of 6 as well as 4, the metal could not be co-ordinated with three molecules of any of the diamines used, a result in favour of the uniplanar configuration for the 4-co-ordination complex.

It is probable that most bivalent metals, including platinum and palladium, can, on co-ordination, assume the uniplanar or the tetrahedral configuration, according to the nature of the co-ordinating groups.

Prof. G. T. Morgan agreed that the assumption by the molecule of a uniplanar or tetrahedral configuration might well depend on circumstances. It was possible that in the series, nitrogen \rightarrow antimony, the differing atomic volumes might constrain the associating units to arrange themselves differently. Prof. Morgan gave examples of the differences already observed, and remarked that some of the work on the platinum compounds was carried out more than 50 years ago; it was desirable that these early results should be re-examined.

Dr. F. Challenger discussed :—

The mechanism of the formation of citric and oxalic acids from sugars by Aspergillus Niger. [With T. K. Walker and V. Subramaniam.]

WHEN the mould is grown on potassium hydrogen saccharate solution, potassium citrate is formed. The importance of saccharic acid in the mycological production of citric acid is evidenced by its isolation in the form of its potassium hydrogen salt from cultures of *A. niger* on glucose. Calcium saccharate is produced when the mould is grown on solutions of calcium gluconate. This was to be expected since gluconic acid is known to be formed when *A. niger* is grown on glucose.

The formation of acetone in cultures of *A. niger* on citric acid (J. 1927, 200) was ascribed to the decarboxylation of acetonedicarboxylic acid, although proof of the presence of this acid was lacking; it has now been detected in ammonium citrate cultures.

Oxalic acid is produced by growth of the mould on ammonium acetonedicarboxylate. Acetic acid may readily be obtained from *A. niger* cultures on citric acid. Under similar conditions, glyoxylic and oxalic acids are

formed in *A. niger* cultures on solutions of calcium glycolate and ammonium glycolate respectively, thus affording further evidence that the change acetic \rightarrow oxalic acid proceeds as already suggested.

Dr. R. H. Pickard referred to the industrial importance of such studies, and expressed the hope that the kinetics of the various stages would eventually be worked out. The cotton industry was interested in retarding, and the leather industry in accelerating the reactions.

In reply to Prof. H. Bassett, Dr. T. K. Walker said that the mould grows vigorously over a wide p_H range; the acidity may appreciably influence the formation of intermediates, but no systematic study in this direction had yet been undertaken.

Dr. W. Wardlaw discussed :—

The complex cyanides of molybdenum. [With W. R. Bucknall.]

ABNORMALLY, molybdenum and tungsten in the complex cyanides $K_4Mo(CN)_8$ and $K_4W(CN)_8$ are converted by acid permanganate to the quinquevalent state only. The oxidation from the quadrivalent to the quinquevalent condition is now clearly shown by the isolation of the complex salts $R_2Mo(CN)_8$ from the fully oxidised solution of $K_4Mo(CN)_8$. The complex acid $H_3Mo(CN)_8 \cdot 3H_2O$ has also been prepared. From a consideration of the electronic theory of valency an explanation of this abnormal oxidation with acid permanganate is put forward. New salts $[Cu(NH_3)_3]Mo(CN)_8$, $[Cu(en)_2]_2Mo(CN)_8$ in which the copper exhibits co-ordination numbers of 3 and 4 have been prepared and a study of the so-called red and blue cyanides of quadrivalent molybdenum has been made. The action of concentrated nitric acid on $K_4Mo(CN)_8$ can be made to yield a complex acid $H[MoO_3(CN)_2 \cdot 2H_2O]$ in which molybdenum is quinquevalent. Further oxidation with acid destroys the complex salt.

Dr. S. Sugden read the following paper :—

The parachor and chemical constitution. Part VI. Some cases of supposed ring-chain tautomerism. [With F. B. Garner.]

THE parachor, because of its strictly additive character, is unable to distinguish between tautomers which differ only by the position of a double linking in the molecule. If, however, isomeric change causes the production of a ring instead of a double linking, the isomerides should possess different values for this constant.

The values of the parachors of quinone, toluquinone, succinyl chloride, the two forms of phthalyl chloride, benzil, and 2:2'-dimethoxybenzil indicate that these substances, with the exception of the higher melting isomeride of phthalyl chloride, all possess the normal structure and, in the liquid state, cannot contain more than a small amount of the isomeride in which a new ring is produced by isomeric change.

The parachors of the phthalyl chlorides indicate that the form m.p. 15° has the symmetrical structure, whilst the isomeride m.p. 88.5° has the unsymmetrical formula.

Prof. R. Robinson described :

The colouring matters of carajura. [With E. Chapman and A. G. Perkin.]

CARAJURA, a rare red pigment prepared from *Bignonia*

chica, contains peaty matter, wax, a coloured resin, silica, calcium oxalate and other salts of calcium, magnesium and potassium, and colouring matters, of which two have been isolated. The more important of these, *carajurin*, $C_{17}H_{14}O_5$, is the anhydro-base corresponding with a dihydroxydimethoxyflavylium salt. On boiling with hydriodic acid, it yields *carajuretin hydriodide*, $C_{15}H_{10}O_5 \cdot HI$ and from this *carajutin*, $C_{15}H_{10}O_5$, may be obtained in scarlet needles. *Carajuretin hydrochloride* is identified with the synthetically prepared *scutellareinidin chloride*, and is therefore 5:6:7:4'-tetrahydroxyflavylium chloride. The following formula is ascribed to *carajurin* :—

Carajurone, a second colouring matter of *carajura*, appears to be a *carajuretin monomethyl ether*. *Dibromocarajurin dibromide*, $C_{17}H_{12}O_5Br_4$, *dibromocarajurin*, and acetyl derivatives of the hydrated forms of *carajurin* and *carajuretin* have been prepared; *O-penta-acetyldihydrocarajuretinol* is of particular interest.

In an exploration of the ground for the syntheses of quercetaletin and gossypetin, ictol monomethyl ether is shown to be 2:5-dimethoxyresorcinol; the isomeric 4:5-dimethoxyresorcinol has been synthesised from veratrole. The method for the preparation of antiarol has been improved and *antiarolaldehyde* $(MeO)_3C_6H(OH) \cdot CHO$, obtained from it by the Gattermann synthesis. Condensation of *antiarolaldehyde* and *p*-acetylanisole in presence of hydrogen chloride gave 5:6:7:4'-tetramethoxyflavylium chloride, and from this *scutellareinidin chloride* was obtained by demethylation. A number of other flavylium salts, related to this series, have been prepared.

BIOCHEMICAL SOCIETY

A meeting was held in the National Institute for Medical Research on November 7, when the following papers were read :

"A cell-free dehydrogenase obtained from bacteria," by M. Stephenson. By autolysis in the presence of phosphate buffer pH 7.6, a preparation can be obtained from washed suspensions of *B. coli* which dehydrogenates lactic acid in the presence of methylene blue, forming pyruvic acid. This preparation is inactive towards other hydrogen donors hitherto tried, with the possible exception of α -hydroxybutyric acid. In the presence of lactate all Clark's reduction potential indicators are reduced. The enzyme does not transfer hydrogen to oxygen direct, no oxygen uptake and no production of pyruvate occurring in the system enzyme, lactate, air; in the presence of a small amount of methylene blue (1 in 30,000), however, an oxygen uptake occurs approximately equal to the change of the lactate to pyruvate. This oxygen uptake is unaffected by cyanide (M/1000). The intact cell differs from the enzyme preparation in its behaviour towards lactic acid in that it is able to reduce molecular oxygen directly, independently of an

extraneous hydrogen carrier, but this mechanism is inhibited by M/1000 cyanide.

In a paper on "The cause of Andrewes' diazo test for uræmia," G. A. Harrison showed that the substance in uræmic sera responsible for Andrewes' diazo reaction is an indoxyl compound, presumably potassium indoxyl sulphate (indican).

A. Harden and F. R. Henley contributed a paper entitled "The equation of alcoholic fermentation."

"Presence of histamine in tissue extracts," by W. V. Thorpe. Histamine (β -iminazolyethylamine) has been isolated in a state of chemical purity from an extract of fresh ox muscle under conditions which preclude its formation by autolysis or bacterial action. It was suggested that the depressor activity of muscle extracts prepared and tested under the given conditions was due entirely to histamine. No choline was detected. The distribution of depressor activity in extracts of various organs was discussed.

"Note on the induced fluorescence of ergosterol," by O. Rosenheim. A brilliant blue fluorescence is observed when ergosterol is exposed to a source of ultra-violet rays (mercury vapour lamp) from which the visible rays are screened off by "Wood's Glass" and a screen of bromine vapour. Eight specimens of different origin were examined, four of which had been prepared from ergot and the others from yeast. Under the same conditions pure cholesterol, freed from ergosterol by bromine, showed no fluorescence. The phenomenon stood in no relationship, however, to the formation of vitamin D from ergosterol by ultra-violet irradiation. It was found that under certain conditions non-fluorescent preparations of ergosterol could be obtained, which were rendered as highly anti-rachitic by irradiation as the fluorescent ones. Moreover, a specimen of cholesterol which could not be activated and was free from ergosterol, as shown by the spectroscopic test, possessed a strong blue fluorescence. This was traced to a previous treatment with charcoal (Norite), during recrystallisation from alcohol, and a similar treatment induced fluorescence in non-fluorescent ergosterol. Since the same result was also produced by repeatedly recrystallising non-fluorescent ergosterol from ordinary ether, kept in light and containing peroxides, the conclusion seemed justified that the fluorescence of sterols under the above conditions was due to the formation of traces of oxidation products.

"A few observations concerning phosphagen," by M. G. Eggleton and P. Eggleton. Only vertebrates appear to contain phosphagen in their muscles, and of these, muscles which are capable of rapid energy output are, generally speaking, in their resting condition richer in phosphagen than muscles intended for lower rates of energy expenditure. The rate of disappearance of phosphagen in a muscle resting under anaerobic conditions cannot be correlated directly to the rate of production of lactic acid. The phosphagen has diminished to an inappreciable concentration before the lactic acid production has reached a quarter of its final value. Breakdown of phosphagen in a muscle, whether the result of fatigue or heat rigour or the incubation of the minced muscle in $NaHCO_3$ buffer (with or without the addition of NaF), always results in the liberation of free creatine

in an amount roughly corresponding to the phosphagen which has disappeared. When phosphagen is initially present in a minced muscle which is being incubated in the presence of NaF, some conversion of inorganic into organic phosphate can sometimes be observed. But in muscles which contain initially no phosphagen (e.g., plain muscle) no such synthesis has so far been observed.

SOCIETY OF PUBLIC ANALYSTS

A meeting was held on Nov. 2 in the Institute of Pathology and Research, St. Mary's Hospital, at the invitation of that Institute, Mr. E. Richards Bolton, President, being in the chair. The following papers were read and discussed:

"The biological tests for blood," by Sir William Willcox, K.C.I.E., M.D. An outline was given of the evolution of blood tests, from the days when the only differential method available was based on differences in the form and size of the blood corpuscles, down to the refined serum tests of the present time. The author described his technique for examining blood stains, and illustrated his method of filtering the stain extract before applying the serum tests.

"The technique of the precipitin test and its forensic value," by G. Roche Lynch, O.B.E., M.B. After a summary of the theory of the formation of antigens in the blood of a living animal, and an account of the properties of anti-bodies, the author described the various methods of preparing anti-sera, the extraction of blood stains, the filtration and sterilisation of the extract by means of special apparatus, the methods of determining the concentration of the extract, and the various ways in which the precipitin test could be applied. The precautions required and the limitations of the test were discussed, and possible applications of the serum test in the examination of foods were given.

"The use of the blood grouping reactions in forensic investigations," by F. C. Martley, M.A., M.D. The theory and technique of blood agglutination tests were discussed and demonstrated, and the author showed how, by means of the four blood groups in which the blood of different individuals could be classed, it was often possible to distinguish between the blood of different persons. Various applications of the method in forensic work were pointed out.

SOCIETY OF GLASS TECHNOLOGY

The opening meeting for the session was held in Sheffield on October 19, the President, Mr. Walter Butterworth, senr., M.A., in the chair. Following an introductory address by the President, two papers were presented.

"Opal glass, crystal growth and impact brittleness," by J. F. Hyslop. The fluoride particles in an opal glass were globular if the viscosity of the glass was high. With low viscosity the particles assumed characteristic crystalline form. In an opal glass heated under the critical point found by Gehlhoff and Thomas, the logarithm of the particle size was directly proportional to the reciprocal of the absolute temperature. That is, the particle size, for equal times of heating under the critical point, was inversely proportional to the viscosity of the glass. Impact brittleness in opal glass was

associated with several factors. The chief cause of brittleness was the tendency of the glass to produce sharp angular crystals and these might be formed by: (a) the tendency of the matrix to precipitate silica. If the opal was susceptible to this secondary devitrification, a careful choice of working temperature was necessary if the absence of brittleness was desired. (b) the tendency of the glass to grow angular instead of globular fluoride particles. This happened in a glass of low viscosity and such a glass was brittle at low and high working temperatures.

"The detection of selenium in decolourised bottle glass," by E. J. C. Bowmaker, B.Sc., and J. D. Cauwood, M.Sc. The procedure consisted in treating 2 to 3 g. of glass in platinum with 15 to 20 c.c. of hydrofluoric acid and 2 c.c. of strong nitric acid, and evaporating to dryness at about 90° C. To the residue, 4 to 5 c.c. of strong nitric acid was added and the solution again evaporated to dryness. The residue was then dissolved with 5 c.c. of 1:1 nitric acid and a little water added to the solution; 10 c.c. of strong sulphuric acid was added and the whole evaporated until fuming for a few minutes. The solution was allowed to become quite cold, when a piece of codeine sulphate, about the size of a pin's head, was added and stirred until dissolved. The solution was then heated to the fuming point when a green coloration denoted the presence of selenium. Manganese and copper must be absent.

CORRESPONDENCE

"THERMS"

SIR,—Mr. Butterfield's comparison between gas and electricity (Transactions, p. 407) might be carried one step further by calculating the price of electricity per therm and also giving the costs of coal and oil on a therm basis, thus:—

Coal at 20s. per ton	is equivalent to	$\frac{3}{4}$ d. per therm.
Fuel oil at 4½d. per gallon	..	2¾d. per therm.
Town gas	..	7d. to 10d. per therm.
Electricity at 1d. per unit	..	29d. per therm.

The above costs are very suggestive, especially from the point of view of the "transport of therms." A transport system (land and water) is already in existence for the stuff which costs ¾d. per therm. Is it really worth while to build a costly system of overhead transmission lines for the stuff which costs 29d. per therm?

At the same time it is not quite fair to electricity to make the comparison on a therm basis, and it would be interesting to read an authoritative article on the cost of generating electricity in a medium-sized works where low-pressure steam from the generating plant could be utilised to the full for heating purposes. At the Edinburgh meeting one heard mention of costs of generation which made a penny a unit sound very expensive.

I remain, Sir, etc.,

R. H. ATKINSON

REGISTRATION AND THE TITLE "CHEMIST"

SIR,—The report of the Registration Committee of the British Association of Chemists has now been published in the "Chemical Practitioner," and it may be of interest shortly to discuss the reasons which have caused the

Committee to employ the term the "Register of Chemical Practitioners."

Besides not wishing to encroach upon any legal right possessed by the Pharmacists, the Council and Committee are, at least, doubtful, if it is in the best interests of the profession of Chemistry officially to employ the title "Chemist." Even in the minds of the best-instructed section of the public it has become associated with pharmacy, and to eradicate that impression, having regard to its traditional and legal associations, even if justified, will be exceedingly difficult. This does not necessarily mean, however, that the name, as a matter of courtesy, cannot be employed as heretofore. Strictly, no physician without a doctor's degree has any right to describe himself as a doctor, but custom freely permits the use of the title. If it were employed officially, however, a great deal of confusion would result. Without being exact, the analogy is sufficiently close for practical illustration, and the new *official* title suggested by the committee seems admirably suited to overcome a difficulty which has appeared to some a real obstacle to recognised legal status.

I am instructed to state that copies of the "Chemical Practitioner" containing the report can be obtained from the Registered Office of the Association, "Empire House," 175, Piccadilly, London, W.1. price 6d. post free.

We have noted with interest the correspondence appearing in your columns regarding the salary and conditions of chemists. If those who are interested in the economic situation of chemists will call by appointment at the offices of the Association, we shall be happy to supply them with evidence of the numerous cases in which the Association has been able successfully to deal with the question of salary and conditions. The Association cannot, however, except in special cases, act for those not included within its membership.

I am, Sir, etc.,

HY. T. F. RHODES.

General Secretary,
British Association of Chemists

PERSONAL AND OTHER ITEMS

The King has approved the following awards this year by the President and Council of the Royal Society:—A Royal Medal to Sir Thomas Lewis, F.R.S., for his researches upon the vascular system. A Royal Medal to Prof. J. C. McLennan, F.R.S., for his researches in spectroscopy and atomic physics.

The following awards have also been made by the President and Council: The Copley Medal to Sir Charles Sherrington, O.M., F.R.S., for his distinguished work on neurology. The Davy Medal to Prof. A. A. Noyes for his work in physical chemistry, especially on the subject of electrolytic solutions. The Buchanan Medal to Dr. Major Greenwood for his statistical researches and other work in relation to public health. The Hughes Medal to Mr. William D. Coolidge for his work on the X-rays and the development of highly efficient apparatus for their production.

The Harrison Medal was presented to Mr. Francis H. Carr, C.B.E., President of the Society of Chemical Industry, on the occasion of the Harrison Memorial Lecture at the Pharmaceutical Society on November 8.

Prof. W. A. Bone, D.Sc., F.R.S., will deliver a lecture entitled "Gaseous Combustion at High Pressures" at the Chemical Society, Burlington House, on Thursday, November 24, at 8 p.m.

Sir Josiah Stamp, G.B.E., has been appointed chairman of the London, Midland & Scottish Railway in succession to Sir Guy Granet. Sir Josiah Stamp is also a director of Imperial Chemical Industries, Ltd.

The Council of the British Association has decided to recommend the General Committee to apply for a Royal Charter, and to accept the offer by Mr. A. A. Campbell Swinton to bear the cost.

One man was killed and three injured owing to the fall of a dye vat, weighing about a ton, which was being hoisted into place at the Huddersfield works of the British Dyestuffs Corporation, Ltd., on November 5.

Representatives of the U.S. Tariff Commission are coming to Europe to investigate the cost of the British crushing process for the extraction of linseed oil, costs in the Belgian glass industry, etc., in relation to an inquiry into an increase of duties under the U.S. Tariff Law.

The death is announced of Sir William Galloway, whose pioneer investigations showed that coal dust in the air of mines was the cause of explosions, and that an explosion could raise further dust from the floors and walls of galleries and so spread the explosions to other parts of the mine. He advocated the use of stone dust as a means of preventing explosions as long ago as 1898.

The death is announced of M. Maurice Prudhomme, who discovered Alizarin Blue in 1877 and took out several patents for the application of aniline black.

The Empire as an Economic Unit

Sir Alfred Mond delivered an address on "An Empire Economic Unit," before the Empire Industries Association, on November 2. Sir Alfred Mond said that on the discovery of a solution of the problem of organising the British Empire as an economic unit, depended the prosperity of the masses in this country and the future existence of the Empire itself. A glance at the economic groupings to-day showed the United States a continent protected from the rest of the world by a tariff ring, yet having a free exchange of goods between New York and San Francisco, and, on the other hand, a Europe in which the idea of an economic union was making obvious headway. Was Great Britain prepared to enter the tariff fence of Europe and to become one of the factors of the European economic unit with all that it implied? Were we to remain suspended in isolation between two vast groups? He saw only one way out of this dilemma, and that was by creating an Imperial economic unit which would, in fact, be more powerful than either of the other two units. If that were done, the problems now pressing upon us would take on wholly different aspects. When we ceased to look on this country as a unit and brought in all the agricultural territories of the Empire, it would be realised that so far from there being industrial over-development, there was still room for vast industrial expansion within the Empire. He was sometimes told that Great Britain had nothing to bargain with in negotiating trade agreements, but as a plenipotentiary of the British

Empire, with all its raw materials and resources at his back, he would undertake not only to negotiate, but to dictate terms. In fact, inter-Imperial trade had become in recent years a more and more dominating factor in the trade position of this country, and it was for us to increase that trade to its utmost limits and to secure a more systematic development in conference with the Dominions as to what each different part of the Empire was to do. Industries created under existing tariffs could not be wiped out, but future consumption and growth could be allocated partly to one and partly to the other, and it was quite possible to form an Empire pool for the compensation of industries and workpeople suffering from the reduction of tariffs. Economic theories were tools, not masters, and should be applied in ways which would procure the best results.

A New Antiseptic

An account of a new antiseptic, marketed by the Mond Staffordshire Refining Co. under the name of "Monsol," was given at a luncheon at the Carlton Hotel on November 3. Sir Alfred Mond said the new antiseptic had been derived from the products obtained from coal tar. Sir Arthur Slogett, who was Director-General of the Army Medical Services in the war, described the medical tests of the antiseptic, and said that "Monsol" was non-poisonous and had extraordinary germicidal power; it could be applied to the skin, to the throat, it could be swallowed, and it could be injected; it was something new and quite unlike anything else, and it had strong medical testimony behind it. Mr. Henry Mond explained that only after extensive use in hospitals and in private medical practice had they felt justified in introducing "Monsol" to the public. He thought the antiseptic would be exceptionally useful in veterinary work.

New Biological Buildings at Birmingham University

The new buildings for the departments of biochemistry, botany and zoology of the University of Birmingham, formally opened on October 20 by the Prime Minister, Mr. Stanley Baldwin, form part of the original design of Sir Aston Webb, the University architect. Situated close to the chemical department, they have cost, with equipment, £120,000, and of this £40,000 has been given by Sir William Waters Butler, Bart., brewer, who is also a chemist. The biochemistry department occupies the greater part of the first floor. Each of the three departments has its own lecture rooms, and there is, in addition, a very large lecture theatre.

The British School of Malting and Brewing and Department of Biochemistry of Fermentation was opened in 1900 as a department of Mason College (the predecessor of the University), with the late Prof. Adrian Brown in charge. The high reputation of the Department for training and research built up by Prof. Brown has been maintained during the eight years which have elapsed since his death, under Prof. A. R. Ling. Many papers dealing principally with the carbohydrates and the chemistry of starch have been published. Reliable methods have been described for the estimation of starch in barley, wheat, and potatoes. Several papers have been published describing studies on the products of the hydrolysis of starch by enzymes, as a result of

which much light has been thrown on the nature and constitution of starch and of the products formed during the mashing process. In addition, researches have been conducted on glycogen, pectins, hemicelluloses, and on various other subjects. In addition to the fermentation industries, the Department also deals with agriculture and cognate industries; chemistry and bacteriology as applied to food and drugs; and water supply.

Desiccation of Sugar Beet and the Extraction of Sugar

The Ministry of Agriculture and Fisheries has issued a "Report on an Investigation into the Desiccation of Sugar Beet and the Extraction of Sugar-beet Effluents," by Dr. B. J. Owen (H.M. Stationery Office, 1927. Pp. 84. Price 2s. 6d.).

The report deals with the work on this important problem which has been in progress for some time at Oxford. It is shown that sugar-beet cossettes can be successfully dried if certain factors are taken into account. Caramelisation can be avoided if the drying temperature does not exceed 220° F., whilst drying must be rapid to prevent the formation of invert sugar; a suitable and economic time is 45 min. Two processes are described, one in which the beet is not moved during drying, and one in which the beet is treated in continuous or intermittent motion on a belt or movable trays, and hot air is passed through it at intervals to produce progressive desiccation.

Trials with both small and large-scale diffusion plant showed that juice up to 50° Brix could be obtained from dried cossettes, the juices being purer and more highly concentrated than those obtained from fresh beets. It is concluded: that no rupture of the cell-membrane occurs, either in single or two-stage drying, so that extraction can only take place by diffusion (and not by lixiviation, as De Vecchis states); and that the albuminoid bodies are equally coagulated by both methods of drying, though the second stage tends to be uneconomic and productive of inversion.

The purification of raw juices of 50° Brix was found to be attended with difficulties unless due regard be taken for the viscosity of the juice and the relative concentration of the impurities and their effect upon filtration. When suspended impurities were removed by mechanical clarification, before or after liming, the purification became simple, the juice then being brought to the required alkalinity and filtered.

A new sequence of operations in the system of boiling and crystallisation is described, which, it is thought, offers economies worthy of the attention of the sugar industry.

In an appendix on the treatment of effluents, it is pointed out that, though the amount of effluent in the desiccation process is much reduced, the effluent is still a potential source of trouble. Trials carried out with a Brackett screen and a Pennell-Wyllie filter showed that the use of a system of screening and filtration, means being provided so that either recirculating or direct discharge could be used, offers distinct advantages for the treatment of the effluent. The method works well with the conveying and wash waters, and it is considered that the process waters could probably be purified by the same method, excess lime being used in the filter.

Low Temperature Carbonisation

It is announced that an agreement has now been signed in the United States between the Public Service Electric & Gas Co., New Jersey, and International Combustion Engineering Corporation, New York, to put down in the township of Raritan, State of New Jersey, a "K.S.G." low-temperature carbonisation plant, which will be the largest in the world. The plant, which will occupy a site of 38 acres, and will be completed on March 1, 1929, will consist of eight standard "K.S.G." process retorts, each with a daily throughput of 80 tons of coal. This will give 2,000,000 to 3,000,000 cb. ft. daily of rich gas of 800 B.Th.U. per cb. ft., which is to be mixed with blue water-gas to bring up the total to 4,000,000 cb. ft. of town gas, of 530 B.Th.U. per cb. ft., continuity of supply being guaranteed, with a production of 450 tons of smokeless fuel (10-12% volatile matter), and 14,000 gallons of low-temperature tar. Included in the equipment is a very large carburetted water-gas plant, in two separate sections, capable of producing 3,000,000 cb. ft. of gas of 530 B.Th.U. per day, giving the desired output in the case of any stoppage of the low-temperature plant.

The "K.S.G." retort is a horizontal rotary steel cylinder, 76 ft. long and 10 ft. in diameter, having an inner cylinder 5 ft. 8 in. diameter, with external heating, giving about 2½ hrs. carbonisation with maximum temperature zone of 950 to 1000° F., and 10-12% volatile matter in the residual smokeless fuel. Particularly important is the claim that in this way bituminous coal dust and smalls can be converted direct under continuous operation into comparatively large pieces of smokeless fuel, equal or superior in value to lump coal.

The "K.S.G." (Kohlenscheidungs-Gesellschaft) process of low-temperature carbonisation has been in operation at the Matthias Stinnes 1/11 Colliery, Karnap, near Essen, since 1924, utilising gas-coal smalls and dust.

The International Combustion Engineering Corporation controls the "K.S.G." process (formerly a project of Hugo Stinnes) and the "McEwen-Runge" process for the low-temperature carbonisation of pulverised coal, now in operation at the Lakeside Station, Milwaukee, and has a working arrangement with Imperial Chemical Industries, Ltd.

The I. G. Farbenindustrie

The Norsk Hydro company has formally approved of the agreement with the I. G. Farbenindustrie for mutual co-operation in the technical and sales department (cf. CHEM. & IND., Oct. 21, p. 968). The capital of the Norsk-Hydro will be raised from 19 million to 77 million kronen (about £1,050,000 to £4,300,000) by exchange of shares with the I. G., and the enlargement of the Norwegian synthetic ammonia factory is to be put in hand with the object of increasing the output of fixed nitrogen threefold.

The decision of the German Railway Company to allow the I. G. a lower rate for the transport of "synthetic petrol," has led to an application by the petrol associations for similar concessions. In making the application the I. G. claimed that the ordinary (higher) rate would make it impossible to market synthetic petrol economically in Germany, and that the concession would not give the I. G. any competitive advantages.

Nitrate for Soviet Russia

According to *The Times*, it appears that arrangements have been made for the transport of high-grade refined Chilean nitrate to Soviet Russia. Nitrate of this quality is, states *The Times*, used exclusively for the production of explosives.

COMPANY NEWS

ANGLO-PERSIAN OIL CO., LTD.

The eighteenth ordinary general meeting, held on November 2, was presided over by the chairman, Sir John Cadman, K.C.M.G., who, after reviewing the accounts (cf. CHEM. AND IND., October 21, 1927, p. 968), said that production amounted to over 4,800,000 tons, which compared closely with the estimate of 4½ millions for last year. The current year's production would probably exceed 5 million tons. The first units for the recovery of petrol from field gas had been running efficiently for some time. Additional plant was now being erected which would enable an extraction of 2½ million gallons of spirit monthly from 900 million cb. ft. of gas. The business in Persian oil carried on by Scottish Oils, Ltd., had continued on an expanding scale, but the position of the shale industry was still unsatisfactory. For some months past the petroleum industry had been in an extremely unsettled condition. The decreased exports from Mexico had been more than offset by large over production in the United States, and by a significant advance in production from South America and elsewhere. As regards the prospects for the current year, unless there was some radical change in prices there was likely to be a reduction in the profits of the company, which might affect the ordinary dividend. At the end of the meeting a resolution was passed ratifying the action of the board in creating for Lord Greenway the special office of president of the company and appointing him thereto in recognition of his valuable services.

CHEMICAL AND METALLURGICAL CORPORATION, LTD.

An extraordinary general meeting was held on November 7, at which resolutions were passed authorising the directors to issue any of the 9,500,000 at present unissued new ordinary shares, and increasing the number of directors to 12 (cf. CHEM. AND IND., Nov. 4, 1927, p. 1026).

ERINOID, LTD.

The twelfth annual general meeting was held on November 3, Mr. Andrew Binnie (chairman) presiding. The result of the past year's working was disappointing, due partly to an increase in the cost of raw material, but mainly to the severe cutting of prices by competitors. For the first eight months business was very quiet, but there had been a rush of business in the last four months which taxed the company's manufacturing capacity to the utmost limit. If the sales continued on their present scale, the results of the coming year should show a substantial improvement. The French company had done well and paid a good dividend. There was no revenue from the American company, but the Board expected to receive a contribution during the current year. (For details of the accounts, cf. CHEM. & IND., November 4, 1927, p. 1026.)

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial.—Cryst., £34 per ton; Powder, £36 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5 5s. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate.—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
Arsenic Sulphide, Yellow.—1s. 9d. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 1d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.
Lead Hyposulphite.—9d. per lb.
Lithopone, 30%.—£22 10s. per ton.
Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.t.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
Sulphur Chloride.—4d.—7d. per lb., carboys extra.
Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
Thiocarbamilide.—2s. 1d. 2s. 3d. per lb., according to quantity.
Vermilion, pale or deep.—6s.—6s. 3d. per lb.
Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 10s.—£10 per ton. Good demand.
Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
Red Liquor.—9d.—10d.
Wood Creosote.—1s. 9d. per gal., unrefined.
Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
Wood Tar.—£4—£5 per ton.
Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals, 7½d.—8d. per lb. Crude 60's, 2s. 3d.—2s. 5d. per gal.
Acid Cresylic, 99/100.—2s. 11d.—3s. per gal. 97/99.—2s. 4½d.—2s. 8d. per gal. Pale, 95%, 2s. 3d.—2s. 6d. per gal. Dark, 95%, 2s. 1d.—2s. 3d. per gal.
Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil. Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.
Toluole.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—2s. per gal.
Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.
Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7½d. per gal. ex works. Salty, 7d. per gal., loss 1½%.
Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10d. per gal. Solvent 95/160, 1s. 3d.—1s. 4d. per gal. Solvent 90/190, 9½d.—1s. 3d. per gal.
Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
Naphthalene.—Crystals, £11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
Pitch, medium soft.—85s.—87s. 6d. per ton, f.o.b. according to district. Market firm.
Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/150—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 6d. per lb.
Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
Acid H.—3s. per lb.
Acid Naphthionic.—1s. 6d. per lb.
Acid Neville and Winther.—4s. 9d. per lb.
Acid Sulphanilic.—8½d. per lb.
Aniline Oil.—8d. per lb., naked at works.
Aniline Salts.—8d. per lb., naked at works.
Anthranilic Acid.—6s. per lb., 100%.
Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—5½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—1s. 10d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.

Dinitrochlorbenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

a-Naphthol.—2s. per lb. d/d.

β-Naphthol.—10d. per lb. d/d.

a-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

p-Nitraniline.—1s. 7d.—1s. 8d. per lb.

m-Nitraniline.—3s. per lb. d/d.

o-Nitraniline.—5s. 9d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—7½d.—8½d. per lb.

p-Toluidine.—2s. per lb., ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—Cryst. 40s.—43s. per cwt. Powder 44s.—47s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 6½d.—1s. 7½d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 4d. per lb. Technical 11½d.—1s. per lb. Good demand.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Amidol.—9s. per lb. d/d.

Acetanilide.—1s. 6d.—1s. 8d. per lb. for quantity.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. 6d. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—10s. 4d.—10s. 7d. per lb. Bismuth Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—9s. 10d.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb. Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Subchloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.—8s. 1d.—8s. 4d. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 24s.—27s. per cwt. Powder 26s.—29s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 2d.—2s. 4d. per lb. Potassium. 1s. 9½d.—1s. 11d. per lb. Sodium.—2s.—2s. 2d. per lb.

Granulated ½d. per lb. less. All spot. Large quantities at lower rates.

Calcium Lactate.—1s. 2d.—1s. 3½d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in carboys; Winchesters, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchesters, 5s. per gal.

Hydroquinone.—2s. 11d.—3s. 2d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—18s.—20s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £32 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.K. recryst., B.P., 17s. 9d. per lb. net.

Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 6s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonat.—8s. 9d.—9s. per lb.

Metol.—11s. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2½%.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—6d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.

Resorcin.—3s. 9d.—4s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net.
 Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7½d.—1s. 9d. per lb. Crystal,
 1s. 8½d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton
 according to quantity, delivered U.K.
 Sulphonal.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to
 quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Aubepine (*ex Anethole*).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s.
 per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl
 Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d.
 per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—
 4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—
 (*ex Bois de Rose*) 15s. per lb.—(*ex Shui Oil*) 10s. 6d. per lb.
 Linalyl Acetate.—(*ex Bois de Rose*) 18s. 6d. per lb.—
 (*ex Shui Oil*) 14s. 6d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.
 —1s. 8d. per lb. Vanillin.—16s. 6d.—17s. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb.
 Bergamot.—26s. per lb. Bourbon Geranium.—13s. 6d.
 per lb.
 Camphor.—75s. per cwt. Cananga, Java, 15s. 9d. per lb.
 Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d.
 per oz. Citronella.—Java, 1s. 10d. per lb. c.i.f. U.K.
 port, for shipment over 1928. Ceylon, Pure, 1s. 8d.
 per lb. Clove, pure 5s. 3d. per lb.
 Eucalyptus, Australian.—2s. 2d. per lb. Lavender.—Mont
 Blanc, 28/40%, 17s. per lb. Lemon.—7s. 3d. per lb.
 Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d.
 per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian,
 75s. per oz. Palma Rosa.—10s. per lb. Peppermint
 —Wayne County, 15s. 9d. per lb. Japanese, 8s. per
 lb. Petitgrain.—8s. 6d. per lb. Sandalwood—Mysore,
 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST.

They
 Chancery Lane, London, W.C. 2, on Nov. 17th. 1927. Complete Specifications
 marked * are those which are open to public inspection before acceptance.
 The remainder are those accepted.

I.—Applications

Anme-Luther Werke Braunschweig. Impact or beater
 mills. 28,608. Oct. 28. (Ger., 31.1.27.)

Bramwell, and Synthetic Ammonia & Nitrates, Ltd.
 Heat-exchangers. 28,595. Oct. 27.

Campbell. Apparatus for treating solids with liquids.
 28,351. Oct. 25.

Denham. Grinding etc. machines. 28,753. Oct. 28.

Fischer. Purifying gases. 28,358. Oct. 25. (Ger.,
 24.12.26.)

Garland. Edge filtration. 28,736. Oct. 28.

Laing and Nielsen. Coating or impregnating granular
 materials etc. 28,454. Oct. 26.

Laughlin Filter Corp. Centrifugal separators. 28,860.
 Oct. 29. (U.S., 30.10.26.)

Lazarus. Prevention of boiler incrustation. 28,890—1.
 Oct. 29. (Ger., 12.1.27 and 21.7.27.)

Olsen. Heat-exchangers. 28,507. Oct. 26.

I.—Complete Specifications

18,071 (1926). Puening. Heating method and apparatus.
 (255,866.)

7940 (1927). British Furnaces, Ltd., and Smith (Surface
 Combustion Co.). Furnaces or kilns. (279,317.)

9017 (1927). Smet-Solvay Co. Distillation. (269,517.)

14,182 (1927). Trocknungs-, Verschwelungs- und Vergas-
 ungs-Ges., and Bartling. Rotary annular sole plate ovens.
 (279,343.)

14,225 (1927). Trocknungs-, Verschwelungs- und Vergas-
 ungs-Ges., and Bartling. Annular rotary hearth ovens.
 (279,344.)

*28,224 (1927). Schmidt. Regenerative ovens or furnaces.
 (279,505.)

II.—Applications

Anglo-Persian Oil Co., Ltd., Dunstan, and Thorpe. Liquid
 fuels for internal-combustion engines. 28,897. Oct. 29.

Bueb, and Dessauer Vertikal-Ofen Ges. Production of
 mixture of coal gas and water gas. 28,234. Oct. 24.

Cornelius and Flodin. Continuously producing and drying
 briquettes. 28,354. Oct. 25.

Fischer. 28,358. See I.

Griffin and Laing. Pulverising etc. coal etc. 28,270.
 Oct. 24.

I.-G. Farbenind. Extraction of carbon dioxide from gases.
 28,209. Oct. 24. Recovering acetylene from gases. 28,748.
 Oct. 28. (Ger., 16.11.26.)

Jacques, and Shotts Iron Co. Complete gasification of
 solid fuel. 28,303. Oct. 25.

Soc. Anon. d'Ougrée-Maribayce. Manufacture of coke, and
 electrodes therefrom. 28,734. Oct. 28. (Fr., 9.8.27.)

II.—Complete Specifications

10,642 (1926). Hart. Manufacture of fuel briquettes.
 (279,140.)

18,782 (1926). Crisp. Apparatus for purifying coal gas.
 (279,184.)

20,670 (1926). South Metropolitan Gas Co., and Lamprey.
 See VIII.

27,580 (1926). Simmance. Gas calorimeters. (279,253.)

7920 (1927). Johnson (I.-G. Farbenind.). Production of
 fuel gases. (279,316.)

8196 (1927). Barker (Cunningham). Mechanically-ope-
 rated gas analysers. (279,319.)

14,503 (1927). Johnson (I.-G. Farbenind.). Catalytic
 production of hydrocarbons. (279,347.)

*24,916 (1927). Spilker, Zerbo, and Ges. f. Teerverwertung.
 Hydrogenating and splitting hydrocarbons etc. (279,410.)

*27,621 (1927). Hoyois. Treatment of coals, ores, etc.
 (279,447.)

*27,912 (1927). Siemens & Halske A.-G. Determination
 of carbonic acid in flue gases. (279,478.)

*27,952 (1927). Florentin, Kling, and Matignon. Obtain-
 ing light hydrocarbons from complex organic compounds.
 (279,488.)

IV.—Applications

British Dyestuffs Corp., Ltd., Baddiley, Brightman, and Chorley. Disazo dyes. 28,495. Oct. 26.

Carpmael (I.-G. Farbenind.). Manufacture of 1-8-naphthoxypenthiophen compounds. 28,386. Oct. 25. Manufacture of new derivatives of anthanthrone. 28,387. Oct. 25. Manufacture of anthraquinone dyestuffs. 28,516. Oct. 26.

I.-G. Farbenind. Manufacture of diacydyl-derivatives of the naphthalene etc. series. 28,225. Oct. 24. (Ger., 23.10.26.) Manufacture of vat dyestuffs. 28,749. Oct. 28. (Ger., 18.11.26.)

Imray (I.-G. Farbenind.). Manufacture of dyestuffs. 28,757-9. Oct. 28. Manufacture of nitrosamine printing-colours. 28,760. Oct. 28.

Johnson (I.-G. Farbenind.). Condensation of phthalic anhydride etc. 28,211. Oct. 24. Manufacture of condensation products of phthalic anhydride etc. 28,212. Oct. 24. Manufacture of azo dyestuffs. 28,214. Oct. 24.

IV.—Complete Specifications

10,633 (1926). Thomson, Thomas, and Scottish Dyes, Ltd. Manufacture of dyestuffs and intermediates. (278,496.)

12,906 (1926). Imray (I.-G. Farbenind.). Manufacture of azo-dyestuffs. (279,146.)

21,074 (1926). British Dyestuffs Corp., Shepherdson, and Thornley. Manufacture and use of vat dyes of the benzanthrone series. (279,205.)

1082 (1927). Carpmael (I.-G. Farbenind.). Reduction of aromatic nitro compounds. (279,283.)

2047 (1927). I.-G. Farbenind. Manufacture of mono-diazo-compounds of 1:4-diaminoanthraquinone mono- or disulphonic acids. (264,879.)

11,845 (1927). I.-G. Farbenind. Manufacture of a yellow azo-dyestuff. (270,352.)

*22,462 (1927). I.-G. Farbenind. Manufacture of dyestuffs of the anthracene series. (279,401.)

*26,565 (1927). I.-G. Farbenind. Manufacture of azo dyestuffs and their chromium compounds. (279,429.)

*27,293 (1927). I.-G. Farbenind. Manufacture of dye intermediate. (279,436.)

*27,915 (1927). Soc. Chem. Ind. in Basle. Manufacture of vat-dyestuffs. (279,479.)

*28,225 (1927). I.-G. Farbenind. Manufacture of diacydyl-derivatives of the naphthalene and acenaphthene series. (279,506.)

V.—Applications

British Celanese, Ltd., Bower, Dreyfus, Kinsella, and Taylor. Production of artificial filaments etc. 28,193-4. Oct. 24.

British Celanese, Ltd. Cellulose products. 28,580. Oct. 27. (U.S., 4.11.26.)

Chamberlain and Periam. Production of films from cellulose etc. 28,501. Oct. 26.

Du Pont de Nemours & Co. 28,360. See XXII.

Grenaudier. Recovery of wood pulp from printed matter. 28,328. Oct. 25. (Fr., 25.10.26.)

I.-G. Farbenind. Production of cellulose acetate solutions etc. 28,444. Oct. 26. Spinning artificial silk. 28,761. Oct. 28. (Ger., 30.10.26.)

Johnson (I.-G. Farbenind.). Manufacture of coloured compositions from cellulose esters etc. 28,475. Oct. 26.

Ward. Treatment of paper pulp etc. 28,418. Oct. 26.

V.—Complete Specifications

10,485 (1926). Hands, and Spicers, Ltd. Compositions containing cellulose esters, ethers, etc. (279,139.)

12,253 (1926). I.-G. Farbenind. Manufacture of preparations of alkyl cellulose. (252,176.)

14,362, 20,659 (1926). Classen. Production of cellulose. (279,147.)

29,042 (1926). Clavel. Treatment of artificial silks. (277,602.)

4285 (1927). Gillis. Degumming flax straw. (279,302.)

4880 (1927). Handelsmaatsch. Fibra. Producing wood pulp. (267,107.)

8495 (1927). Verein f. Chem. Ind. See XX.

*27,294 (1927). I.-G. Farbenind. Desulphurising viscose silk. (279,437.)

*28,151 (1927). British Celanese, Ltd. Treatment of organic derivatives of cellulose. (279,502.)

*28,328 (1927). Grenaudier. Recovery of pulp from printed paper. (279,516.)

*28,360 (1927). Du Pont de Nemours & Co. See XXII.

VI.—Applications

Burrell, Hallworth, Holden, and Livsey. Treatment of textile materials etc. 28,539. October 27.

Carpmael (I.-G. Farbenind.). Manufacture of piece-dyed tissues. 28,385. Oct. 25.

Elhs (Chem. Works, formerly Sandoz). Dyeing effect threads. 28,636. Oct. 27.

I.-G. Farbenind. Printing with vat dyestuffs. 28,481. Oct. 26. (Ger., 26.10.26.)

Imray (I.-G. Farbenind.). 28,760. See IV.

VI.—Complete Specifications

18,155 (1926). Calico Printers' Assoc., Lantz, and Watson. Production of aniline black on textile fibres. (279,164.)

21,074 (1926). British Dyestuffs Corp., Shepherdson, and Thornley. See IV.

31,765 (1926). I.-G. Farbenind. Dyeing cellulose acetate silk. (262,830.)

VII.—Applications

Clay Reduction Co. Production of aluminium compounds. 28,326. Oct. 25. (Norway, 25.10.26.)

Ebers. Preparatory treatment of crude heavy spar. 28,353. Oct. 25.

I.-G. Farbenind. 28,209. See II.

Johnson (I.-G. Farbenind.). Production of green hydrated chromium oxide. 28,213. Oct. 24.

Metallbank u. Metallurgische Ges. Production of alumina. 28,519. Oct. 26. (Switz., 26.10.26.)

Pauling. Combustion of ammonia. 28,250. Oct. 24. (Ger., 22.10.26.)

VII.—Complete Specifications

3928 (1927). Komlos, Komlos, and Engelage. Manufacture of carbon disulphide. (265,994.)

15,515 (1927). I.-G. Farbenind. Maintaining the stability of dibasic calcium hypochlorite. (276,307.)

*11,384 (1927). Gaillard. See XVI.

*25,887-8 (1927). Caro and Frank. Production of cyanamides or mixtures containing them. (279,419-20.)

*28,250 (1927). Pauling. Combustion of ammonia. (279,511.)

*28,326 (1927). Clay Reduction Co. Production of aluminium compounds. (279,515.)

VIII.—Complete Specifications

20,670 (1926). South Metropolitan Gas Co., and Lamprey. Refractory bodies such as carbonising retorts. (279,201.)

26,740-2 (1926). Studien-Ges. f. Wirts. u. Ind. Cementing of porcelain. (260,592-3, and 274,408.)

IX.—Applications

Borgestad Fabr. Building material. 28,795. Oct. 28.

Bowran & Co., Ltd., and Craggs. Heat non-conducting composition. 28,785. Oct. 28.

Knudsen. Building-material. 28,796. Oct. 28.

IX.—Complete Specifications

15,301 (1926). Kraus. Building cement or plaster. (253,929.)

6956 (1927). Chamberlain. Protection of wood against rot and decay. (279,313.)

16,031 (1927). Pickstone. Manufacture of cement mortar, artificial stone, concrete, etc. (279,355.)

X.—Applications

Aluminium-Ind. A.-G. Electrolytic extraction of aluminium. 28,392. Oct. 25. (Ger., 22.11.26.)

Gower, and O'Brien and Partners. Electroplating aluminium etc. 28,320. Oct. 25.

Jirotska. Refining aluminium etc. 28,755. Oct. 28.

Meyer. Manufacture of steel. 28,575. Oct. 27. (Ger. 6.12.26.)

Robson. Roasting zinc sulphide ores. 28,265. Oct. 24.

Witter. Purifying tin ores etc. 28,667. Oct. 27.

X.—Complete Specifications

18,035 (1926). Powell, Deering, and Johnson, Matthey & Co., Ltd. Extracting metals. (279,156.)

22,987 (1926). Klein and Brown. Treatment of ores etc. containing titanium and iron. (279,219.)

24,715 (1926). Nilson. Manufacture of low-carbon metals and alloys. (260,232.)

27,924 (1926). Weishan. Production of soft iron. (278,303.)

31,749 (1926). Smith. Impregnating metals etc. with aluminium and aluminium alloys. (279,273.)

32,043 (1926). Marks (Kemet Laboratories Co.). Thorium alloys. (279,274.)

12,662 (1927). Bährmann. Superheating blast furnace and cupola furnace slag and addition of certain lacking constituents. (271,087.)

*29,351 (1926). Wittek. Reducing zinc ores. (279,370.)

*7542 (1927). Krupp A.-G. Sintered hard metal alloys. (279,376.)

*25,769 (1927). Internat. Nickel Co. Chill cast iron alloys. (279,414.)

*25,770 (1927). Internat. Nickel Co. Gray iron alloys. (279,415.)

*26,069 (1927). Corson. Alloy. (279,425.)

*27,621 (1927). Hoyois. See II.

*28,041 (1927). British Thomson Houston Co., Ltd. Alloys. (279,490.)

XI.—Applications

Aluminium-Ind. A.-G. 28,392. See X.

Elliott. Electric accumulators. 28,413. Oct. 26.

Gower, and O'Brien & Partners. 28,320. See X.

Hitchen. Electric batteries. 28,703. Oct. 28.

Kugel. Electrolyte for lead accumulators. 28,745 and 28,805. Oct. 28. (Ger., 6.11.26 and 24.5.27.)

Petithory, and Siemens Bros. & Co. Electric insulating-material. 28,789. Oct. 28.

Soc. Anon. d'Ougrée Marbais. 28,734. See II.

Surjaninoff. Electric induction furnaces. 28,648. Oct. 27. (Austria, 30.10.26.)

XI.—Complete Specifications

23,815 (1926). Stichling. Electric batteries. (279,228.)

14,861 (1927). Brown, Boveri, et Cie. Electric furnaces. (272,227.)

XII.—Applications

Soc. Française de Centrifugation, and Rozieres. Recovering fatty material from emulsions. 28,374. Oct. 25.

Vidal. Production of fatty bodies soluble in water. 28,471. Oct. 26. (Fr., 5.11.26.)

XIII.—Applications

Bakelite Corporation. Phenol resins. 28,629—30. Oct. 27. (U.S., 10 and 11.11.26.)

Nittinger. Producing bright paints. 28,218. Oct. 24.

XIII.—Complete Specification

18,446 (1926). I.-G. Farbenind. See XX.

XIV.—Complete Specifications

242 (1927). Burrage. Vulcanisation. (279,280.)

12,326 (1927). Rubber Latex Research Corp. Stabilised latex. (279,336.)

*24,457 (1927). Baer. Making an elastic caoutchouc-like body. (279,406.)

XV.—Application

I.-G. Farbenind. Manufacture of hardened casein products. 28,480. Oct. 26. (Ger., 26.10.26.)

XV.—Complete Specification

*27,406 (1927). I.-G. Farbenind. Manufacture of solutions of gelatin in organic solvents. (279,443.)

XVI.—Complete Specifications

*11,384 (1927). Gaillard. Obtaining superphosphates with a low percentage of moisture. (279,380.)

*25,891 (1927). Caro and Frank. Producing an alkaline-reacting nitrogen fertiliser. (279,421.)

*25,887—8 (1927). Caro and Frank. See VII.

XVII. Complete Specifications

27,450 (1926). Raffinerie Tirlemontoise. Curing masses. (274,799.)

27,451 (1926). Raffinerie Tirlemontoise. Removal of false grain from sugar syrups or molasses. (274,800.)

27,455 (1926). Raffinerie Tirlemontoise. Process for decolouring sugar crystals. (278,302.)

XVIII.—Complete Specification

8535 (1927). Commercial Solvents Corp. Art of butyl-acetonic fermentation. (278,307.)

XIX. Applications

Bau. Treating flour. 28,700. Oct. 28.

Ellis. Manufacture of cattle foods. 28,412. Oct. 26.

Lutax, Ltd., and Sutcliffe. Treatment of food etc. 28,540. Oct. 27.

XIX.—Complete Specifications

18,065 (1926). Epstein. Egg product. (279,159.)

*27,934 (1927). Perino. Manufacturing a vegetable alimentary product. (279,487.)

XX.—Applications

Chem. Fabr. vorm. Schering. Manufacture of alkylisopropylphenols etc. 28,388. Oct. 25. (Ger., 26.10.26.)

Manufacture of condensation products from cresols and ketones. 28,389. Oct. 25. (Ger., 26.10.26.)

Manufacture of decomposition compounds from condensation products of cresol etc. 28,390. Oct. 25. (Ger., 26.10.26.)

Manufacture of higher alkylated guanidine derivatives. 28,674. Oct. 27. (Ger., 28.10.26.)

Chem. Fabr. vorm. Schering, and Jordan. Manufacture of condensation product from *m*-cresol and acetones. 28,803. Oct. 28.

Holzverkohlungs Ind. A.-G. Production of acetone. 28,220. Oct. 24. (Ger., 4.11.26.)

I.-G. Farbenind. Manufacture of stable solid solutions of salts of aromatic sulphonic acids. 28,616. Oct. 27. (Ger., 27.10.26.)

Manufacture of organic compounds containing oxygen. 28,747. Oct. 28. (Ger., 15.11.26.)

Imray (I.-G. Farbenind.). Improving perfumes. 28,876. Oct. 29.

Johnson (I.-G. Farbenind.). Production of esters of silicic acid. 28,210. Oct. 24.

XX.—Complete Specifications

18,377 (1926). Binz and Râth. Production of organic arseno compounds. (255,892.)

18,446 (1926). I.-G. Farbenind. Treating decamphorated oil of turpentine. (255,896.)

28,308 (1926). Râth. Preparation of means for fighting bacterial diseases. (262,080.)

30,219 (1926). U.S. Industrial Alcohol Co. Dehydrating alcohol by distillation. (268,728.)

8495 (1927). Verein. f. Chem. Ind. Recovery of high percentage acetic acid from solutions of acetylcellulose in acetic acid. (268,778.)

*8536 and 10,648 (1927). Commercial Solvents Corp. Catalysts for synthetic methanol production. (279,377—8.)

*11,080 (1927). Poulenc Frères, and Fourneau. Manufacture of orthochloroparaaminoglycinamidephenylarsinic acid. (279,379.)

27,511 (1927). I.-G. Farbwind. Manufacture of physiologically-active extracts. (279,445.)

XXI.—Application

Chamberlain and Periam. Light-sensitive films etc. 28,502. Oct. 26.

XXI.—Complete Specification

*14,366 (1927). Gschöpl. Production of natural colour pictures. (279,381.)

XXII.—Application

Du Pont de Nemours & Co. Pyroxylin compositions. 28,360. Oct. 25. (U.S., 25,10,26.)

XXII.—Complete Specification

*28,360 (1927). Du Pont de Nemours & Co. Pyroxylin composition. (279,520.)

XXIII.—Application

Burgess (Elrod). Sewage-purifying device. 28,172. Oct. 24.

XXIII.—Complete Specifications

2452 (1927). Rosenheim. Increasing base interchange capacity of glauconite etc. (265,578.)

*27,817 (1927). Frank. Separating tarry substances from water. (279,465.)

*27,828 (1927). Selden Co. Base-exchange bodies. (279,466.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number: *British India*: Bleaching and dyeing plant (368); Iron and steel (369); Centrifugal pumps (A.X. 5425). *Canada*: Glue (371). *China*: Air compressors, transporting gear (387). *Colombia*: Dynamite, detonators (A.X. 5420). *France*: Briquetting plant and presses (376). *Holland and Dutch East Indies*: Soaps, perfumes, etc. (381). *Hungary*: Leather and tanning materials (382). *Norway*: Raw materials for soap and margarine works, chemicals (384). *South Africa*: Structural steel (A.X. 5424). *United Kingdom*: Fish scale essence (8143/27).

Rubber Restrictions

It is officially announced that no change will be made for the present in the regulations which govern the export of rubber from Ceylon and Malaya. If the Governments concerned consider any changes to be necessary, right is reserved to make them as from February 1, 1928, due notice to be given.

An Old Publishing Firm

In connexion with the change of address of J. & A. Churchill, Ltd., medical and scientific publishers, from 7, Great Marlborough Street, to larger premises at 40, Gloucester Place, Portman Square, London, W.1, the firm has sent an interesting brochure from which we learn that the firm was founded in 1825, by the late John Churchill, the grandfather of the present partners, Messrs. A. William and J. Theodore Churchill. The firm has published the Medical Directory since 1845,

and includes amongst its authors many distinguished names, such as Crookes, Michael Foster, Frankland, Huxley, Ramsay, Tilden, Watts and many others.

News from Advertisements

Chief chemist, also assistant chemists with knowledge of artificial silk viscose process, required (p. vi).

A meeting of the Chemical Society Research Fund Committee is announced (p. vi).

A filter (No. 5 Sweetland) is for sale (p. vi).

Various sets of this JOURNAL and other books are offered (p. vi).

Two patents are available for negotiation (p. vi).

There are now 126 firms represented in our Buyers' Guide.

EDITORIAL

Research at High Pressures

THERE seems to be no likelihood that there will be any diminution in the quantity of chemical research or any decline in its importance. On the other hand, we have every reason to expect that the discoveries of the next generation will surpass those of the past and the present. No doubt many branches of chemical research will become obsolete; the methods employed in them will, at some time, have yielded so much of importance that subsequent work will involve no new principles and will discover merely neater or more economical ways of making substances whose properties are already known. Many new synthetic dyestuffs may be prepared, but they will hardly make such changes in organic chemistry and in industry as resulted from the discovery of aniline, alizarine, mauve, and Congo Red. We have other fields to explore and new paths open to us. It is a long time since it was found out that the raising of the temperature could have so great an effect on the starting or the speed of a chemical action. It is only quite recently that high pressures have been required in the manufacture of chemical compounds on an industrial scale; that this new device is of great importance is obvious, and we think that very few of us know much of its possibilities or have had any opportunity of seeing how experiments may be made with this new contrivance, or how it may most effectively become a means for increasing the happiness and prosperity of mankind. The study of chemical actions at high pressures involves engineering plant and engineering knowledge: the days of the pneumatic trough are over; there are few places where the modern developments in this direction can easily become available, and we are therefore particularly interested to read of the provision of equipment of two high-pressure gas research laboratories at the Imperial College of Science and Technology, London. Imperial Chemical Industries, Limited, and the Department of Scientific and Industrial Research are helping to finance this new department in a generous fashion, and we feel sure that many students will be glad to learn to work in the new labs. under the supervision of Prof. Bone and his assistants. High pressures, high temperatures, and high voltages will in time revolutionise the chemical industry, and if X-rays, α -rays, and electrons can also be harnessed for the

convenient use of the manufacturer no one will be surprised. Every house now has its water, gas and electricity laid on; what further services will be commonplace installations in chemical labs. fifty years hence? Shall we have a tap for liquid air and another for compressed α -rays? Shall we have a switchboard that will give us temperatures, pressures, and conditions we now do not even contemplate? We must wait and see; meanwhile the Department of Chemical Technology of the Imperial College will lead us a good many steps nearer to the knowledge of the future.

Transport

There can hardly be any serious need to emphasise the importance of transport in our modern world. Yet the problems which we have to face cannot be entirely new. The Carthaginians well knew what it meant to handle a large trade in perishable articles, and even in Pompeii, if we remember aright, there are signs that a system had been introduced which regulated traffic with a characteristic Roman directness, though we do not suggest that our modern roads should be reduced in width, or large stones placed to catch erring wheels. If it is no consolation to reflect, while the escalator carries us down in the tubebound torrent, that the method is very similar to that which might be used for soap or any other kind of package, yet we are glad to be reminded by Mr. Pooley that no country is more fertile in the production of handling apparatus than our own, and we think he is equally right when he adds that, owing to the age of our industry generally and its growth in constricted quarters, no country is faced with greater difficulties in applying such apparatus. When a new works is to be erected, the problem of ensuring an appropriate flow of material is very different from that presented by an existing plant which requires to be modernised. In these matters, the fresh, untrammelled point of view is of the greatest importance, and we think that an article such as that by Mr. Pooley will be of considerable assistance in calling attention to the many devices which are now available for use in the factory. The economic aspects of the question are considered by Mr. West, who points out the chief questions which must be faced and answered, even if but partially, if efficient and successful working is to be

maintained, whilst Major Hatcher deals with what is probably the most important part of a conveyor, the means by which its power is transmitted. The subject is a very large one indeed, as may be illustrated by reference to the important volume on "The Mechanical Handling and Storing of Material," by G. F. Zimmer, published by Crosby Lockwood & Son, at the price of three guineas. This book, republished in 1922, contains over 800 pages, and deals exhaustively with the automatic and semi-automatic handling and storage of commercial products. When the book was first published in 1905 it was the first book of its kind, certainly in English, and probably in any language. Since then it has attained its third edition, and the care with which obsolete matter has been deleted or replaced by new material in each edition has enhanced its reputation. The treatment is complete and thoroughly practical, the illustrations are abundant and to the point, and the production is excellent. It is a curious thing that, as far as we are aware, it is very difficult to ascertain theoretical expressions for the design of particular types of handling apparatus. Zimmer gives all the details one could want in practice, but we should like to know if the theory of the subject has been developed. Perhaps some chemical engineer could enlighten us.

Chemistry and Man

A suggestive paper on "Hormones" was recently read before the South Wales Section of the Society by Mr. D. H. Hey. The chemistry of hormones is important enough, but Mr. Hey went into matters of more fundamental concern when he pleaded for a better understanding of life. It is possible, if we understand Mr. Hey aright, that the sinister power of scientific research may eventually frighten us. We must, he says, bend our steps in the direction of discovering how, by chemical means, we shall be able to control those unhealthy conditions of mind which are responsible for crime and immorality.

But is it suggested that we should all depend upon chemical materials to control our passions and inspire us to well-doing? If this be so, how can we ever escape the charge of absolute materialism and entire disregard of the inherent nobility of man?

Fifty or sixty years ago, what was perhaps wrongly called the conflict between science and religion was largely brought about, we think, by the narrowness of outlook shown by many learned specialists. As years passed broader views prevailed, and it came to be realised that the mind of man was large enough to comprehend not only the control of natural forces, but also a more intangible spirituality of existence. To-day scientists—and chemists in particular—are in danger of having thrust upon their shoulders the mantle of materialism. Humanity is becoming aware of the power of science, and, misapplying it in various directions, is seeking to excuse itself in a confusion of thought which affirms that science, wholly materialistic in outlook, is responsible. We are told that preventive medicine enables armies numbered in millions of men to be kept in the field in the time of war without the fear of pestilence or destruction by disease. Preventive medicine, therefore, is responsible for world wars! Chemistry has taught us how to make fearsome high explosives and toxic gases.

Engineering and aeronautics have taught us how to build tanks and bombing aeroplanes; physics may soon give us a terrible "death ray." Therefore these branches of science are responsible for war!

The argument is absurd, for the misapplication of scientific discovery is a responsibility which the whole of humanity must shoulder, and scientists must take only their share of the blame.

It is not sufficient, however, to put forward a destructive defence on behalf of science. Scientists must be constructive in thought and action, not only in their own specialised fields, but also in the world of humanity. Science must not comprise merely the wizardry of witch doctors, the avarice of alchemists and the barbarism of blood-letters; she must not only administer to the creature comforts of man and advance his control over natural forces, but she must be worshipped by those who, whilst paying her a worthy homage, have still time to prove to their fellow-men that they envisage a nobler humanity and refuse to accept the charge of materialism.

We have often pleaded that man cannot live by chemistry alone, and asserted our conviction that the chemist brings profit to himself and the world at large by his comprehension of the value of art and literature, music and philosophy, and the humanities in general. Men will give him credit for adding to the comfort of their lives—whether Sir Alfred Mond's measure of relative comfort to-day and in the past is correct or not—but they will give him the greater credit if, in addition, he moves amongst them, plays his part in the higher organisation of humanity, and shows himself to be a man first and a chemist second.

Inspiration to a higher culture and a nobler humanity is not vested in the pure research chemist, who may at first sight be considered to have the better opportunity, by reason of his temperament and environment. In his delight of the beauty of truth, he may be as selfishly narrow as the industrial chemist who thinks of naught but what may fructify upon the credit side of the balance sheet. The industrial chemist has, indeed, a wide scope in the study of human inter-relationships. The idea of the nobility of all work well done and the development of a newer craftsmanship are steps along the road, away from materialism and towards a higher ideal, but they cannot be taken in an atmosphere of distrust and suspicion. It is not too much to claim that the chemical industry is taking a lead in improving human inter-relationship. The late Lord Leverhulme gave us evidence of this in his Messel Memorial Address, and the recently-announced labour policy of Imperial Chemical Industries, Ltd., affords additional proof. We welcome such great gestures in the drama of the understanding of life.

Man's inhumanity to man may be intensified, but is certainly not caused by chemical or general scientific research and endeavour. All the same, however, scientists must show by constructive action that they repudiate the charge of being responsible for a deadening materialism. Then neither will the Bishop of Ripon need to counsel a ten years' holiday for science, nor shall we have to await the discovery of chemical substances for the control of unhealthy conditions of mind in order to progress to a nobler humanity.

HIGH PRESSURE GAS RESEARCH. NEW DEVELOPMENTS AT THE IMPERIAL COLLEGE OF SCIENCE AND TECHNOLOGY

For some months past there has been a movement to finance and develop on a more permanent basis the research work on gaseous combustion at high pressures continuously carried out since 1920 under the direction of Prof. W. A. Bone, F.R.S., in the Department of Chemical Technology of the Imperial College of Science and Technology, London. In view of the special experimental technique developed, and of the highly-skilled staff of research assistants engaged upon the work, it has been felt that the College is in a specially favourable, if not unique, position for offering facilities for training selected post-graduate students in high-pressure gas research methods, and in the design of apparatus and plant in connexion therewith, which are matters of growing importance in relation to new developments in chemical industry.

Up to now the heavy expenses of the researches have been defrayed out of grants made by the Government Grant Committee of the Royal Society and the Department of Scientific and Industrial Research; but in view of the future new developments now contemplated, it became necessary to have these supplemented from other sources. Accordingly, on hearing of the position, Imperial Chemical Industries, Limited, generously gave the sum of £3,000 for the provision of further equipment, and has promised a further annual subsidy towards the running costs; and at the same time, in order to support and expedite fundamental research work on high-pressure reactions, the Department of Scientific and Industrial Research has agreed to increase its present grant by an amount sufficient to pay the salaries of the staff of four research assistants *plus* a mechanical assistant, on condition that the College provides, out of its own resources, an instructional assistant in connexion with the work.

Accordingly two new high-pressure gas research laboratories are now being equipped under the scheme, namely, (1) 56 × 35 feet, divided into four sections by steel partitions, for the accommodation of high-pressure explosion bomb installations, and two pressure catalytic tube units with accessories, and (2) 36 × 33 feet, in which means and apparatus for preparing, storing, and compressing gases, the determination of compressibilities, the testing and calibration of standard gauges, etc. will be installed.

Outside the building is an experimental gas generator plant and a 3000 cb. ft. gas holder for use as required. There are also 100 cb. ft. and numerous 10 cb. ft. gas holders available for storage. The equipment, when complete, will include (*inter alia*), (a) two gas compressors, one working up to 200 and the other up to 1000 atmospheres pressure, (b) a wide range of explosion bombs capable of withstanding explosion pressures of 100, 1000, 2000 and 20,000 atmospheres, respectively, and (c) catalytic-tube units capable of withstanding pressures up to 500 atmospheres at 500° C.

It is expected that most, if not all, of the new equipment will have been installed ready for operation by the end of March next. There will then be room to

take a limited number of selected post-graduate research students for a systematic training, extending usually over not less than two years, in high-pressure gas research methods. The work will be organised and carried out under the personal direction of Prof. Bone, who will be assisted in it by Drs. D. M. Newitt and D. T. A. Townend, each of whom will be in charge of two research groups, and Mr. W. E. Stockings, M.Sc., who will be in charge of the gas preparation and compressing arrangements, and also act as the instructional assistant.

As the number of vacancies for qualified students in connexion with the work is limited, early application should be made to Prof. Bone at the Imperial College of Science and Technology, London, S.W.7.

WORKS TRANSPORT FROM THE ECONOMIC POINT OF VIEW

By J. H. WEST, A.C.G.I., A.M.Inst.C.E.

Transport into, within, and out of a works may be compared to the alimentary and blood circulations of a human body. Any interference with its regular operation in any part of the system will cause economic ill-health, and if of a serious nature, and allowed to remain unremedied, may ultimately prove fatal. Hence a close study of the various conditions to be satisfied if the circulatory organs are to be maintained in good health, and also of the symptoms and remedies required in case of disorders, is very desirable.

From the economic point of view, we are concerned with but two factors, which are really only one, *viz.*, time and money. We are not dealing here with the technical aspect of various methods of transporting and handling materials. All we need concern ourselves with is whether, to put it bluntly, the staff, labour and appliances available can handle the stuff quickly enough, cheaply enough, and without breakdowns or other interruptions, or whether it would pay to make improvements.

Take the railway sidings of a large works. Perhaps the works has been considerably extended during the last few years, but the sidings remain as they were twenty years ago, and now have to handle double the traffic they were originally intended for. What is the result? Delay in getting materials to where they are wanted and hence reduction of output, charges for demurrage on trucks not promptly unloaded, often double handling because urgent goods have to be unloaded elsewhere than at the proper place, unnecessary night work, increasing the cost of shunting and unloading, and reduced opportunities for repairing the permanent way. On the other hand, to extend the sidings and adapt them to present and possible future requirements is a very expensive business. Will it pay to do it? That is a question which can only be answered after a thorough examination of the cost of the work and of the saving to be effected. Probably a detailed study of the actual conditions during a month or three months will be necessary to ascertain accurately the loss of money which is occurring from the causes mentioned above and other similar ones. Then, if the interest on the capital required to extend the sidings, plus the extra cost of upkeep and depreciation do not exceed the saving to be effected, the job is worth doing.

Similarly, in the case of any internal transport problem, whether it is a matter of moving a few tons of material per day only a few feet, or of taking hundreds of tons per day from one end of the works to the other, the economic questions always are :

- (1) What is it costing by present methods ?
- (2) Are the present methods being worked in the most efficient and economic manner possible ? ; and
- (3) Could it be done cheaper and better some other way ?

These questions often cannot be answered anything like correctly without a good deal of trouble being taken, for it is rarely the case that works costs are analysed to a sufficient extent for the exact cost of any given transport operation to be ascertainable from existing figures, but the trouble involved is, in the writer's opinion, well worth while, for it is only by this means that the management can ascertain what the actual cost is, and whether it can be improved upon. The investigation must, of course, take into account all the items of cost involved, such as a fair proportion of salaries and other overheads, including interest on the capital cost of the handling plant, depreciation, wages, fuel or steam, power, stores such as oil and waste, repairs and replacements, losses caused by breakdowns, loss of or damage to materials, and so on.

Furthermore, the investigation should extend over a sufficiently long period of time to yield figures which represent average conditions, say three months at least, unless the conditions in a given case remain very constant from day to day and from week to week, and even then a short period might either include or miss a bad breakdown which would alter the results enormously. Obviously, the longer the period taken the more closely the results will approach the true average. To avoid the trouble of making such an investigation as that suggested, it may be considered good enough to estimate the various items of cost, but this procedure is, in the writer's opinion, very risky, and may involve such serious errors as to make the results misleading and valueless, particularly with regard to such items as power absorbed and repairs.

However, with this word of warning we may assume accurate costs to have been obtained, and pass on to the consideration of how improvement may be sought. Taking the simpler cases of hand manipulation first, considerable saving can sometimes be effected by close attention to details. The substitution of piece work for day work, the provision of more suitable shovels or other implements, more convenient barrow runs or stagings, or the substitution of narrow-gauge tipping trucks for barrows may help. Simple details like these are often overlooked just because they are simple, and nobody bothers to ask the men whether their work is made as easy and convenient as possible for them. Yet the easier it is made the cheaper it can be done.

In cases where it is a question of replacing hand work by mechanical appliances, or of replacing an inefficient mechanical appliance by a more efficient one, there is now available such an immense variety of appliances of all kinds that the choice of the most suitable for any given case is sometimes no easy matter.

However, before even considering making a change it is well to be sure that the best is being got out of the existing arrangement. Is the appliance in thoroughly good working order and adjustment, and running at the right speed ? Or is it consuming too much power, or giving a poor output ? Further, is it being utilised in the most efficient and economical manner having regard to the daily tonnage to be handled and the hours it is working ? There should be no hurry to make changes until these and similar questions have been answered, and any necessary tuning up carried out. Should improved methods seem called for, a fresh investigation has now to be made to ascertain the capital and working costs of the most likely schemes so that they may be compared with each other and with the existing costs, in order to find the best economic solution. Here, unfortunately, it is rarely possible to obtain actual working costs unless a similar appliance to that under consideration is already in use in some other part of the works, or figures can be obtained from some other works where it is in use. Guarantees of the power required can usually be obtained from the makers, but it is difficult to estimate repairs and upkeep, and still more difficult to compute the chances of a breakdown.

This question of the possible breakdown of mechanical appliances is a very important one, particularly if the trouble is serious and no alternative method of supply is provided. It is not, of course, suggested that handling appliances are any more liable to breakdown than other classes of machinery, but unless the avenues of supply are duplicated, which is rarely the case, the stoppage of the only avenue will probably have much more serious effects upon output than the breakdown of a unit of process plant where duplication or, at any rate, sub-division into multiple units, is more usual. Hence everything possible should be done to provide regular attention and examination, and to have a reasonably complete set of spare parts on hand, but some accident may occur which involves, for example, sending away for a casting, and several days' complete stoppage. It is an old and very true saying that it is not while a plant or machine is running, but when it has broken down that it becomes really expensive. Some alternative method of supply should, therefore, be available, otherwise serious loss of output will result. Money is often grudged for spare parts, but their presence in the stores is an insurance policy against prolonged breakdown. This question of spare parts and emergency replacements provides a strong argument against using foreign-made appliances, for which it will take much longer to obtain replacements.

Turning next to the human element, it should not be necessary to emphasise the need for expert supervision in each department, whether railway, canal or internal handling, such as cranes, elevators, conveyors, ropeways, pumps, and so on. Yet how many pounds are lost every week in some works through lack of a thorough knowledge of railway rates and regulations, or inefficient organisation of road transport, and how many mechanical appliances are condemned as inefficient, or, worse still, left running in an inefficient manner, through sheer lack of competent management and fair treatment ?

Then, almost if not quite as important as spare parts for appliances is the question of relief men for skilled transport work. If a locomotive, crane or lorry driver is away through accident or illness, is there anyone to take his place? Yet the absence of a relief is as bad as if the machine were disabled, whilst the employment of an inexperienced man may result in accident or damage.

Cheap and efficient transport is undoubtedly a very important factor in works economics; in fact, it may be truly described as one of the main essentials of successful working, so that it deserves, and will amply repay, very careful study; and it is hoped that this short article may prove useful in calling attention to some of the more important economic aspects of the question.

CONVEYOR DRIVES AND GEARING

By MAJOR E. C. HATCHER

Possibly the most important part of a conveyor is its power transmission system, consequently, time given to a careful consideration of the most suitable form of drive for a particular type of conveyor is well invested. Generally speaking, there are four forms of drive, each of which, under certain circumstances, has merits of its own; these are as follows:—

1. Belt drive
2. Chain drive
3. Open gear drive
4. Totally-enclosed gear drive.

There are, of course, also various combinations of the four systems. To consider the merits of each system it is as well to keep in mind certain factors: namely, cost of transmission unit, cost of installation, durability, efficiency, amount of space taken up, silence, and accessibility.

In the case of the belt, this form of drive can only be satisfactorily employed where the difference in speed of the prime mover and conveyor shaft is small and where the speed of the conveyor shaft is relatively high, so that only a low torque has to be dealt with. It is also usually very difficult to arrange for the long run of belt which is absolutely necessary if this type of drive is to function satisfactorily.

The principal advantages of the belt drive are:—Low cost of material, low cost of installation, flexibility and quietness in operation. Where the main drive of the conveyor is provided by one of the three other systems, the belt drive can sometimes with advantage be employed between the prime mover and the first stage of the transmission system, particularly where changes of speed are sometimes required, stepped pulleys being used in conjunction with the belt. A belt used in this way is sometimes a very useful safety link when employed on the drive of a conveyor which has a tendency to "pile up" and jam.

The chain drive suffers in many respects the limitations of the belt drive, particularly so far as speed ratios are concerned. It is possible, however, to transmit heavy torques by means of the standard type of roller chain. One of the disadvantages of the roller chain

drive is that it cannot be satisfactorily employed in connexion with high-speed prime movers unless very carefully protected and running in an oil bath, in which case the unit becomes unwieldy and expensive. The silent inverted tooth chain is somewhat better than the roller chain in this respect, but is considerably more expensive. A well-designed drive of this type is very efficient, and has a reasonable life if not overloaded, and if well protected from dust etc. This form of drive is comparatively flexible, but should be provided with a breaking link where used in conjunction with conveyors that are likely to jam.

Chain drives are sometimes used to drive to the top terminal of an elevating conveyor, and in such case it is most important to avoid having one chain sprocket vertically above the other chain sprocket, since such an arrangement induces rapid wear and the provision for adjustment is almost impossible, except by means of a jockey pulley, which is an added complication. Sprockets and chains have relatively low cost, but it must not be forgotten that a substantial mounting of the sprockets and sprocket shaft is necessary, and provision for adjustment is essential.

As a connecting link on the slow-speed end of the transmission system, a chain drive can in some cases be introduced with advantage, particularly where some safety device is required, a breaking link in the chain offering a cheap and simple solution. A certain amount of flexibility is also introduced to a rigid gear system. Where such an arrangement is employed, a speed reduction between the driving and driven sprocket should be introduced, using this mechanical advantage and reducing the amount of torque to be exerted by the gear shaft; smaller gearing can then be employed. Chain drives must be carefully protected to prevent entanglement with operators' clothing, and except at very low speeds are invariably noisy.

The open spur gear drive is probably to-day the most generally used form of conveyor drive. The apparent advantage of the open gear drive system is the relatively low cost of gears; for heavy slow-speed work, rough-cast gears can be employed, and replacements are easily obtained. When looked into carefully, however, it will be seen that the disadvantages of this system of drive are very considerable. The low gear cost is very much affected by the fact that the cost of installation is high and that whilst rough-cast gears can be used, they are exceedingly inefficient and are noisy in operation.

Since it is invariably impracticable to employ a speed ratio of more than 6 to 1 per train of spur gear, it will be seen that to use this system on a slow-moving conveyor, a large number of gears must be used, the result being a cumbersome, noisy and inefficient form of drive. Open gears are also unsatisfactory when used in a dusty and gritty atmosphere, and the care of adequately protecting this form of drive is considerable. Herring-bone gears are, for most applications, more satisfactory in every way than the spur, but the cost often makes their use prohibitive.

In the case of some types of conveyors where the turning effort on the conveyor shaft is very high and the speed low, open spur gears can be satisfactorily used in conjunction with a totally-enclosed speed reducer.

Totally-enclosed gears or speed reducers embrace a large variety of types, including standard worm drives, epicyclic, concentric spur, and the H-R gear manufactured by J. Stone & Co., Ltd., of Deptford, London. The last-named combines the advantages of all the types, being a standard form of gear box in which any speed ratio from 6 to 1 to 100,000 to 1 can be provided. This should not be confused with a variable-speed gear. The H-R gear uses the worm gear as its base, and its patented arrangement permits the use of the most efficient thread angles under all conditions. Whilst this gear is highly efficient for comparatively small speed ratios, its efficiency as compared with other forms of gearing increases as the speed ratio increases.

Because of its special construction, only the smallest number of teeth are necessary on the final driving wheel. Consequently the maximum tooth pitch can be employed. In addition to this feature, since the speed of the prime mover is scientifically broken down before reaching the final driving wheel, the rubbing velocity between this wheel and its driving worm is very low, thus permitting an extremely high loading factor. As a result, the

Fig. 1

H-R gear is for a given torque output the smallest and most compact speed reducer on the market.

An important point to keep in mind when considering a conveyor drive is that the totally-enclosed gear is invariably a self-contained unit, and has only to be connected to the conveyor shaft. Consequently the cost of installation is low. The H-R gear is absolutely silent in operation, which is a most important point, particularly when running in a factory and in close proximity to the factory operatives. This gear is also foolproof, and requires no protection from the point of view of Board of Trade Regulations, and can, of course, be run under any atmospheric conditions. Indeed, cases have been known where the gear has been almost buried in dust, etc.

Durability is, therefore, a very strong point, and although this type of gear is somewhat more expensive than the alternatives, its long life, requiring no attention, more than compensates for this extra cost. It is, of course, understood that this type of gear runs continuously in an oil bath.

In addition to the standard type of H-R gear shown, Fig. 1, a new type is being introduced known as the

H-R balanced drive, which, whilst retaining all the advantages of the standard gear (except that of high ratios, the maximum in the balanced gear being 300 : 1), has a greater shock-resisting capacity. This gear pro-

Fig. 2

vides for the final driving wheel to be driven on both sides of its periphery, thus doubling the number of teeth in contact, and, therefore, the capacity of the wheel. The radial load on the slow-speed shaft is also eliminated, as is also the end thrust on the high-speed shafts. An example of this gear is shown in Fig. 2.

The H-R gear is being increasingly standardised by conveyor manufacturers, and there is no doubt that the time is fast approaching when nothing but totally-enclosed speed reducers will be employed on conveyor drives, except in special cases, such as referred to herein, since experience is proving them to be the most satisfactory and economical, when all factors are taken into consideration.

TRANSPORT IN CHEMICAL WORKS

By H. J. POOLEY, M.I.Chem.E.

Economy in power receives the careful attention of every manufacturer, but economy in man-power is, without doubt, the most acute aspect of the problem, particularly in view of what we still regard as the recent upheaval in labour conditions following the war. The most expensive unit in the equipment of any works is the man with a shovel and a barrow. Even this class of work can be cheapened with the use of specialised implements to an extent which can make an extraordinary influence on the year's balance sheet. There is no country more fertile in the production of handling apparatus than our own, and equally owing to the age of our industry generally and its growth in constricted quarters, there is no country faced with greater difficulties in their application. It is safe to say that no chemical engineer will set out to design a works on a free site without making his first consideration the passage of material, from intake to output in every stage, as free as the flow represented on his flow-chart diagram. His task, confronted with an existing plant, requires much greater ingenuity and resource.

The object of this short article is to place before manufacturers in a concentrated form typical examples of the class of plant available, probably not with the expecta-

tion of disclosing anything novel, but with the hope that the presentation of a selection of these devices and some reference to their advantages and limitations may arouse an interest in dealing with some problem hitherto faced with difficulties.

Transport in chemical works, or in any other factory, may be divided and sub-divided, but will resolve itself, in the main, into three groups:—

- (1) Intake and disposal of raw material.
- (2) Transport in process of manufacture.
- (3) Disposal of the finished produce and waste.

The ideal arrangement is one, obviously, in which material arrives at a rate nearing that of its consumption and passes from stage to stage without intermittence. Such conditions are far to seek, but the user will approach nearest to that ideal when he can arrange his intermittent stages as few as possible and in such a manner that

through abrasion affecting the main structure or the bearings. It is obviously a problem on which it is not possible to generalise, except, perhaps, in this one fact, that there is no investment in which a manufacturer can dispose of his capital with greater security as to the results.

With these few remarks the writer will proceed to show, with brief descriptions, typical instances of handling plant, keeping, as far as possible, to the three broad groups mentioned earlier.

In the case of many materials which are mined or quarried, in the distant vicinity of the works, the cable ropeway with all its simplicity, its low cost of installation and upkeep, and the manner in which it disposes of the difficulty of uneven ground, must be placed amongst the most satisfactory methods of transport, and, since it is not actually transport in the chemical works, it is not referred to in detail, but is so pertinent

FIG. 1

re-handling occurs seldom and inexpensively. Again, he will approach nearer the ideal if, in the necessary moving from point to point, some essential stage of the manufacture can be combined in the transporting operation. Further, it may be found highly advantageous to adopt measures to produce the material in a form which will lend itself to a more convenient transporting appliance than its ordinary state would permit. Reference will be made to cases of this description a little later.

The determining factor of the transport scheme may originate at the very point of arrival, be it barge or larger vessel, rail wagon or road, and, again, in bulk or otherwise. Consideration, for instance, must be given to the relative economy between rapid unloading and bulk storage on the owner's premises, as against the cost of demurrage for rolling stock or ships bottoms, and the value of berthing space in either category. A system which may be ideal for one material may fail entirely in another case, on account of chemical action, wear

to the charge on costs that it should at least be mentioned briefly. An installation of this character by Messrs. Robert Dempster & Sons is illustrated in Fig. 1. Cement works, limestone quarries, and peat users will find this of much service in many instances.

MATERIAL ON ARRIVAL

In most cases at large works material will arrive in bulk, and may be handled in a large variety of ways, according to the material itself and its nearness to the point of original storage.

Grain and light materials, such as many oil seeds, sawdust, etc., are usually handled in pneumatic elevators and delivered direct to the silo or bulk warehouse, a particularly satisfactory method in view of the simplicity of the pipe ducts, their weatherproof character, and the ease of control and distribution. Where a barge can be brought close alongside a factory, a vertical elevator capable of adjustment in a vertical direction and elevating

to a height from which chutes can reach all points of service or storage is convenient and cheap.

The handling of coal, however, will appeal as a problem concerning every manufacturer, and whereas installations may vary from those of the huge gas and power gas undertakings to the comparatively small steam power installation, the general conditions governing differ only in degree. When arriving by wagon the first operation is its discharge, with a view not only to saving time and labour, but having in mind the early release of the wagon, the saving in demurrage, and congestion of the siding. The electric capstan (see Fig. 2) is a particularly handy

The limitations of these devices is found in the necessity for discharging always at the one point. They are particularly applicable where the material is next removed by one of the various forms of conveyors, or in the rare case where the elevation of the rail is such that the material finds its way straight into the usage hoppers. It is a system frequently used in conjunction with the automatic railway, to which it will perhaps be convenient now to refer.

In Fig. 4 is illustrated a double line of this description. It is applicable to situations where the point of arrival is some little height above the point of usage or storage or

FIG. 2.—Electric Capstan (Thos. Broadbent and Sons)

method of moving single trucks, and one which is too seldom seen in extensive use, either in the work described, or in such operations as furnace and stove trolley loading and unloading. The actual discharge may be rapidly effected in two ways. For end-tipping wagons the electric or hydraulic ram is speedy and effective. (Fig. 3.) For side-tipping wagons the revolving cage laid in the track alongside the hopper or elevator boot accommodates the entire wagon, which is clamped in the revolving frame and the latter caused to make one revolution, thus disposing of the contents and re-setting the wagon on the lines for prompt removal (inset of Fig. 3).

ultimate discharge. The track is inclined at a level suitable to the relative point of reception and discharge, and will operate at any inclination steeper than 1 in 33. The truck is loaded from the hopper or by crane grab or whatever method is favoured. It is given a starting impulse by the single operator, gathers momentum and proceeds till the pre-determined point at which a simple barrier is placed across the track immediately before the point of discharge. The wagon gives impulse, via the cable, to a pendulum type of momentum accumulator, which is so weighted that on automatically returning to position it carries sufficient energy to return the empty

FIG. 3.—(Babcock and Wilcox, Ltd.)

truck to the starting point. The weight of the pendulum is adjustable to ensure this result. The wagons are of special construction, with double-side discharge, auto-

Where a large number of points has to be served, or when the coal, as is so frequently the case, arrives at certain periods in a quantity far in excess of immediate requirements, the most usual system of transport is by means of the electric telfer with grab. Briefly, the telfer is an electric hoist trolley, suspended from its track, which may be the upper or lower flange of an H-section joist, receiving its current from an insulated length of collector wires, usually above and alongside the upper rail and usually operated from a cab built in one with the trolley (Fig 5). They are, however, made suitable for distant control, and in some cases, particularly for internal use, with the operator walking below and controlling from that position. Their operation is limited to the area almost immediately below the track, but as the track is comparatively inexpensive, and makes little call on ground space, and as the rail may be conveniently taken to all points of the works, it is a system which has much elasticity. It is employed not only for coal, but for unloading all kinds of work material, as, for instance, salt, chalk, rock phosphate, ores of all description, and so on. As compared with the travelling jib cranes, it has the advantage that the mass moved in addition to the load is comparatively small, whilst all working parts are comprised in the hoist, which can be quickly run into the workshop for repairs or for protection when not in use, and in this respect has an advantage over non-protected conveyors. It is essentially a one-level transporter, and the cost of reaching the highest part has its influence on the whole of the track, and, conversely, where it is desired to pass under bridges and into buildings, the highest point is limited by the highest point of the latter. For dumping coal in the open it is almost ideal. Most coal-unloading operations are intermittent, and the telfer has the advantage that

FIG. 4.—Automatic railway (Babcock and Wilcox, Ltd.)

matically controlled at the pre-determined point, and the discharge is instantaneous and complete. Beyond the one man referred to at the point of arrival, there is no cost in operation.

by suitable extension of the track it can be brought into the works proper, and utilised (Fig. 6).

A method of coal storage and reclaiming receiving some consideration is that of the cable drag scraper,

Fig. 1. Electric trolley with 8 ton grab (Robert Dempster and Son)

furnished by the Underfeed Stoker Co. It depends on outside help to bring the coal or other raw material to

Briefly, it comprises a winding mechanism at the distribution point, a tail block mounted on a rail car running round the limits of the field (or alternately a series of posts for anchorage) and a steel toothed drag skip attached to the cable. Controlled from an elevated operating cabin commanding a view of the whole area, the winding drum drags the whole skip backwards and forwards, full and empty, distributing the accumulated pile at the arrival point. The location of disposal is changed by the simple operation of moving the tail-block. Such a device will deal with 600 tons per hour on a radius of 100 ft., controlled by one man, and dispensing with special structures and tracks. For reclaiming, the skip is reversed on the cable.

Fig. 7 depicts the scraper returning empty. In the work of reclaiming, the load must be brought to the skip elevator for raising to the necessary height for distribution by chutes and conveyors to the feed hoppers of the plant concerned.

The next device to come under review is the skip elevator (Fig. 8), which is specially suited to hopper charging at one point. The makers (Underfeed Stoker Co.) make extensive use of it for feeding the Stoker magazines through the agency of their travelling weigh-larry, thus avoiding permanent overhead bunkers in the boiler house.

The hoist consists of a track, vertical or inclined according to the local requirements, a winding motor and cable, and a rectangular bucket, which, in the automatic form, rises and falls continuously until stopped. The loader is automatically controlled by the passage of the skip itself under the track hopper, whilst suitable buffers at the top discharge point tip the skip. Where the hopper or receptacle is provided

Fig. 6.—Trolley (J. Fraser and Co.) unloading rock phosphate direct to the store

the edge of the storage area, and to remove it when reclaimed, but justifies its cost in all that pertains to the storage area.

with a cover, the skip may be caused to open the latter during tipping.

The maximum capacity is 600 tons per hour. A

semi-automatic type is made for intermittent loading and for less extensive duties.

To the credit of such an elevator must be placed the following points: All moving parts are kept out of reach of the load, and are thus free from abrasive or corrosive action. The bucket alone suffers attack, and can be easily and cheaply renewed. Economical in power on account of light moving parts. The power load does not increase with the height as in the case of bucket and tray elevators.

The next device to be con-

the objections often stated against such appliances, when dealing with dusty abrasive material. Their very wide use would seem to confirm their claims.

FIG. 7.—Cable drag scraper

sidered is bucket elevator and its near cousin the tray elevator—popular and adaptable appliances, particularly for dealing with regular supplies and for distributing—without attention—to various points at short or great distances.

The former, in its best form for heavy duties, is seen in the tilting bucket elevator, Fig. 9 (Babcock & Wilcox), which depicts four elevators, each with a capacity of 60 tons per hour.

In this model the stamped steel buckets have trunnion mountings, on which they swing, and are carried by the side chains; they are each provided with contact cams, by which they are tipped for discharging when coming into contact with the cams of a cross shaft, the position of which may be varied at will. The buckets are loaded by a rotary pocketed charger working in the charge hopper, and this ensures a full load without waste. In transit they swing always horizontally, whether the track be vertical, inclined or horizontal—in this they are distinguished from the ordinary fixed bucket elevator, whose operations are confined to a not very wide angle with the vertical, and whose discharge can only be at the head.

This form of elevator combines the duties of elevator and conveyor, thus adding to its versatility, which is further increased by the adoption, when required, of a transportable filler capable of operating at any intermediate point, being temporarily clamped down during use. The makers have studied very carefully wear in bearings and links, automatic lubrication, the relief of strain on the chain at curves with a view to minimising

In common with all bucket elevators they are unsuitable for dealing with damp clumping material, which,

FIG. 8.—Skip elevator or hoist

for similar continuous vertical and horizontal stream transport, is best left to the push-plate or modified tilting tray type, combined with band conveyors.

Whereas the tilting bucket elevator entails the movement of a heavy mass of material other than the load, it is claimed that the chains are balanced, and that frictional resistance has been so far reduced that this seeming disadvantage becomes unimportant. As the cost of raising material in a 40-ton per hour outfit to a height of 40 ft. amounts to just less than one penny per ton, allowing fully for labour, power, and all overhead expenses, including repairs, the point would seem to be well taken care of.

Available space forbids dealing with the many other devices for bulk unloading and distribution, such as the various forms of jib-crane, either of fixed radius or on travelling tracks, nor of the interesting uses of the horizontal transporter, spanning up to 200 ft., and capable of covering any point of a limitless length of such width—nor the radial transporter dealing with any part of a circular space. Sufficient has been written to indicate the great importance now paid to cutting down expense in handling the raw material, justified in the

merely by the substitution of suitably-shaped arms at the requisite intervals in place of buckets, which entails an allowance for clearance, when passing the sprockets at head and foot or at turns.

MATERIAL IN PROCESS

Pursuing the ideal of a clear flow through the works, it becomes necessary to consider detail operations which may be combined in the transport, and for which the design must allow, and which in many cases may determine the design of the system. Such operations as crushing and grinding invariably entail a loss of height in the flow-level, and the same applies to weighing in bulk, the appliances for which have been so thoroughly perfected in this country. Magnetic separation, screening, etc. can be carried out without great sacrifice of height, and hand sorting and picking is obviously a case for the band, tray or apron conveyor. Where material is arriving fairly constantly, a generous hopperage system above the point of usage, when not ruled out

FIG. 9.—*Tilting bucket elevators and conveyors*

fact that the whole supply of the works exacts its toll of cost at that stage.

In handling packed goods on arrival, much of the plant already referred to becomes available with only suitable adaptation at the point of first attack. There is a sling, clip, hook, cage or skip suited to every need, which is attached to the chain end of the crane, telfer, overhead runway, or whatever means is employed. Much of the apparatus described later for handling finished goods is suitable for passing on such packages as bales, sacks and casks to their first store. A great deal of ingenuity has been expended on perfecting gravity devices for such packages, and the practice is growing of storing the raw material on the upper floors, and passing the packages away gradually downwards to chutes, spirals, roller-ways and similar non-power methods which are always available for use when called on.

Chain-operated elevators and conveyors adapt themselves to the requirements of cases, casks and sacks

by individual difficulties such as heating, packing and congealing, is of great attraction. Coupled with a weigher, automatic or controlled, it permits charges to be carried out and checked with the minimum of labour and time.

Where overhead space and lighting, or the intermittent arrival of material in heavy consignments obtains, there is much in favour of fixed charges, loaded to plant by such devices as the skip elevator and the weighing larry, moving on rails and visiting each point of charge as required. Either of these devices prevents material being held up in hoppers capable of feeding part of the plant or machines only, and those parts possibly immobilised for any reason.

Here is the much deplored extra step creeping in, but the problem of suitable transport is burdened with compromises. In this case, against the pause and its cost must be set the points of light, space and immobility in the important operating area itself, and the ability to have the main storage in cheaper quarters under the

best storage conditions, and free from a possibly damp and polluted atmosphere.

From the stage where chemical change in the materials takes place, the conflict of choice of suitable method and

FIG. 10.—(Fraser)

plant becomes increasingly severe, each case being study in itself, and most of them intriguing.

It is, therefore, increasingly difficult in this brief survey to present any adequate combination for uni-

FIG. 11.—Mixer-conveyor (Scott)

versal sequence. A brief reference will be made to various appliances of typical character, and an example or two of specialised adaptation which may stimulate suggestion for other situations.

The vertical bucket elevator (Fig. 10) is suitable for all materials not heavily corrosive or of a clinging character. The chain driven push-plate conveyor and elevator deals well with wet goods of hard texture and of varying sizes, such as bones, and may suitably be combined with washing operations, as in the case of

FIG. 12.—Band conveyor

vegetable roots, beet, potatoes, etc., or with suitable grid plates, may act as a preliminary cleaner or screener, as exemplified in the feeding of bones to a grease-extractor.

The ordinary worm conveyor, while not the most efficient, still retains popularity for continuous horizontal conveyance of granular materials. It is reasonably cheap, and immune from breakdown, easily supported, free from wearing parts having any influence on the drive, providing due attention be given to the design and lubrication of the intermediate bearings (avoiding excess oil). It is self-supporting over fairly long spans, and, in any case, cheaply carried. It lends itself admirably to operations such as cooling, heating

FIG. 13.—Off-loader for band conveyor

and drying by the aid of jackets, air-currents, etc., and its constant disturbance of its load helps these operations, and provides a uniformity of product most desirable.

As an example of the combination of process and transport, a certain material, in a comparative short distance, required to arrive in a cool state with a new substance added—three operations in one—conveying, cooling and blending. By the use of the Scott patent mixer (Fig. 11), specially designed, the work was carried out in one stage. This mixer depends normally on the interweaving action caused by right and left-hand worms, mounted concentrically on one shaft. By jacketing the mixer, and altering the pitch of the outer spiral to give a slow

propelling motion, the necessary lag was provided to allow the mixing and cooling to be performed effectively in the short space available between the two process stages. A simple solution arrived at by selection and adaptation, but typical.

FIG. 14. —Scott patent vibrator

For rough irregular pieces, sodden but not fluid material, and similar goods not suitable for the screw, and also in fact for granular products, the band conveyor is admirable. Its construction is known to everyone, and is clear from the illustration (Figs. 12 and 13), by Fraser.

FIG. 15.—Pan conveyor (Fraser)

of Dagenham. It requires a more elaborate framing than the screw conveyor, and its drive is not so self-contained, but it is, in actual fact, most durable. The belt, of canvas or rubber or balata-treated canvas, has long life, and is suitable to most materials. By use of the throw-

off, which may be inserted at any point in the travel, the load may be off-loaded at any desired spot. While mainly a horizontal conveyor, it can work on an incline, limited by the natural angle of repose of the material comprising the load—as a rough guide, an angle of about

FIG. 16

28° with the horizontal. The belt is also suitable for the conveyance of cases, sacks, etc., but where a clear choice is permitted for these goods, the slat conveyor where wood slats support the goods, and are carried on side chains, is preferable.

The band conveyor is in every-day use in what may be termed the more detailed chemical manufactures in connexion with operations such as filling, branding, labelling, wrapping and packing, and there is no limit

FIG. 17

to the variety of its applications in such service. The usual method is an arrangement of the machines in straight lines with operatives working on each side of the table over which the band passes, each unit or gang having a specified operation to perform before passing

FIG. 18

FIG. 19

the article forward, usually on the same band, while a cross band collects the finished goods for delivery to the final packing department. Before leaving this form of conveyor, another instance of adapting material to conditions suitable for a particular form of transport comes to mind. An article produced in a clay-like state required drying, and an inclined band-conveyor was installed, leading to a rotary kiln drier. For fuel economy the

result was a perfectly impartial drying right through the machine, a saving in labour of two men and a very considerable reduction in fuel consumption, a satisfactory product, and the avoidance of a great deal of annoyance, while the existing conveyor became satisfactory for its duty (Fig. 14).

The tipping tray conveyor, to which reference is made later, is ideally suited for handling a hot material, plastics

FIG. 20

material was made as dense and water-free as possible and manually loaded in heavy lumps, of irregular size, to the band. On reaching the drier these lumps balled together in the well-known manner, and such portions, dried on the outside, either reached the discharge only partially dried, or the heating had to be so forced to complete it that the more favourably presented material

and similar goods. In transit it presents a practically unbroken, level, metallic, flexible band, discharging at the ends, but capable, by special off-take appliances, of discharging at intermittent points when desired. An illustration of this appears in the remarks under the heading of "Disposal of Finished Products." A

FIG. 21

was probably dry half way through the drier. The solution was eventually found by the employment of the patent "Christy" vibrator (George Scott & Son) in which, by imparting a vibratory motion to the paste in the storage hopper, the material, by readjustment of its crystalline structure, became sufficiently fluid to discharge itself in the shape of a cylindrical ribbon, in which form it entered the drier, still retaining its shape. The

FIG. 22

variation, the Pan conveyor, is useful for the same work or for more liquid goods (Fig. 15).

The telfer can be made a very practical link in any chain of operations, where heavy masses of material must be moved intermittently from part to part of the plant or works, whether these be adjacent or distant. It

has the charm of leaving the roadways and gangways unimpeded for other floor traffic, and, as the illustration (Fig. 16) depicts, can find support for its track by the

FIG. 23

assistance of works buildings. A combination of telfer and travelling crane presents many advantages in handling bulky goods, and an excellent example of this

FIG. 24

is shown in Fig. 17 (Morris) dealing with the espart bales in a paper works, these being conveniently stacked on arrival and ultimately transported to the grass boilers by the same apparatus.

Not every works provides the necessary head-room for a telfer proper, but the electric travelling hoist, as perfected by the firm of Morris, Ltd., and others, makes a very excellent substitute under the conditions. For minor operations and in smaller works, the hand-operated mechanism of the same character, running on light joist

FIG. 25.—Spiral chute for cases etc.

raiscarried from the roof or the ceiling beams of the rooms, can cover, at a low cost, every part of every department, and while rather detailed in this operation, will, when properly designed, cut out a host of manual operations. Several instances of the application of these devices are shown (Figs. 18 and 19).

FIG. 26

In spite of every mechanical appliance, floor transit is almost impossible to avoid, but a multitude of ingenious appliances has been produced to save labour, time, floor space and congestion.

The electric truck, now seen on every railway platform, is a particularly economic, silent and handy method where

FIG. 27.— Discharge head of sluice ash discharger (Underfeed)

effected by the use of loose platforms, cages, etc. to fit the truck chassis, thus avoiding the frequent immobilisation of the more costly truck in loading and unloading operations. The same system has been developed by Herbert Morris, Ltd., in the case of the hand-propelled platform truck, in which the elevation of the platform is carried out on the truck itself by the depression of the traction handle to the draught position. An illustration of this is seen (Fig. 20) and is self-explanatory, but the multitude of its opportunities for man-power economy can only be realised by comparison with the chaotic bustle and congestion alternating with periods of idleness seen in many works and stores.

THE DISPOSAL OF FINISHED PRODUCT AND WASTE

As in the case of the raw material, this work is divided into bulk products and detailed packages, but now the latter predominate. Many of the appliances previously described for the unloading obviously apply to the off-loading, and there is no need to make special reference to them (Fig. 21). The advantage of a hopping system for bulk goods, delivering direct to railway trucks, requires no thought. A favourable instance of this will be seen in the arrangements for loading trucks with coke at the gas works, where the bunkers are situated at a satisfactory level for the purpose, and are fed by a tipping tray conveyor (Babcock & Wilcox, Fig. 22). In many cases, owing to the spasmodic deliveries of the coke, recourse has to be made to the system of storing in the open, exactly similar to that applying to coal, described earlier.

The handling of boxes and other packages in the process of packing can be admirably conducted with the use of the minimum of power by the employment of the

FIG. 28.—A combined handling plant dealing with the revivication of spent oxide (Dempster)

the floors are on the level and of suitable surface. Considerable economy in rolling stock of this nature may be

gravity roller track, of which several illustrations are here presented.

The rollers are mounted in ball bearings and of a width slightly in excess of the largest package concerned. The track requires an inclination of only 1 in 33 to enable the articles to propel themselves by gravity. Where it is necessary to descend from floor to floor immediately, the spiral form is a practical solution, requiring a diameter only of 8 ft. Where it is necessary to increase the elevation either to reach another floor or as a booster to give fresh elevation for further service on the same floor, a double-chain covers this section of the track with bars from side to side to engage with the article and

FIG. 29.—A single chain grab by Rose, Downs and Thompson

thus propel it on the same frictionless track till the desired elevation is reached. The inclination may be varied by the employment of adjustable standards to the track itself, and its adaptability is endless.

The roller system is admirably suited for loading direct to lorries, either from an upper or from a lower floor. A particular application of the band conveyor for dealing with casks and barrels has the merit that it does not interfere with the cross traffic on the same floor. Many of these appliances, such, for instance, as the

slack elevator, are available in a portable form. The illustration (Fig. 23, by W. J. Fraser & Son) shows one such device, while Fig. 24 (Herbert Morris, Ltd.) illustrates a hand-operating machine for stacking and unloading cases, sacks, barrels, etc. in restricted spaces.

The handling of ash and other such waste is the purpose of a variety of transporters, and becomes quite an important problem in a large boiler installation. Perhaps one of the happiest solutions of this problem is found in the water sluice of the Underfeed Stoker Co., which takes the form of a concrete trough in the ash tunnel at the back of the grates, either inclined at sufficient angle to permit the solids to be flushed away direct where the ground levels suit, or arranged horizontally with a drag chain conveyor and elevator for removing the solids and in one operation conveying them to the point of discharge, whether this be a hopper for loading wagons or a settling pit for removal by grab. The ash discharge is sealed in an inch or so of water, and this prevents the entry of air to the furnace—a point of very considerable importance. Moreover, the sudden quenching of the ash and clinker reduces the latter to a final state of division in which it is much more saleable, where any sale exists (Figs. 26 and 27).

The scope of this short article does not permit dealing more fully with many appliances and their application. The chief difficulty in taking an open view of transport in old-established works is the trammels of custom and usage, and this may effectively be avoided by bringing as much new brains as possible to bear on the subject.

CANADIAN HYDRO-ELECTRIC POWER

The Quebec R. L. H. & P. Co. has purchased all the properties and interests of the Corporation d'Energie Electrique de Montmagny and its two subsidiary companies. This places the power and lighting of a number of counties on the south shore of the St. Lawrence River, below Quebec, in the hands of Montreal power interests. The transaction involves holdings and property of a value of approximately \$2,000,000.

Construction work is progressing on the Grand Falls, New Brunswick, hydro-electric development of the St. John River Power Co. (subsidiary of International Paper Co.). This will be the largest hydro-electric development in the Maritime Provinces, and will be initially 60,000 h.p.

The Shawmigan Water & Power Co., Ltd., through its subsidiary, Beauharnois Electric Co., Ltd., has purchased, from the Montreal Cottons, Ltd., the Valleyfield Electric Co., which has been supplying power and light to the industries in Valleyfield and adjacent municipalities. This development will probably prove of importance in the further introduction of industries into the south-western section of Quebec. By this purchase the Shawmigan Co. has consolidated its position on the south shore of Lake St. Louis, and extended it practically to the international boundary of Quebec and New York. This will probably result in the development of industries in a large number of the smaller thriving towns and villages of South-west Quebec, where there is a plentiful supply of good labour and excellent transportation facilities.

"IN CANADA WITH THE EMPIRE MINING AND METALLURGICAL CONGRESS"

By A DELEGATE FROM GREAT BRITAIN

(Concluded)

Our itinerary then took us through the city of Calgary to Banff Springs Hotel, in the "Canadian Pacific Rockies," where rain and snow occasioned the cancellation of our intended visit to the Turner Valley oilfield, in south-western Alberta. Disappointment was natural, but the glorious mountain views on the second day of our stay seemed at the time generous compensation.

Next we visited the Galt mines of the Canadian Pacific Railway, at Lethbridge, where a sub-bituminous coal, suitable for domestic purposes, is being mined from one seam 4 ft. thick. On the same day our trains took us—the "Blue Train" to the collieries at Blairmore, Alberta, and the "Red Train" to those at Fernie, B.C., both in the Crow's Nest Pass through the Rocky Mountains. Here we witnessed the operation of coal cleaning and screening, mainly for the use of locomotives on the Canadian Pacific Railway Company. A visit was also paid to the generating station at Sentinel, Alberta, on Crow's Nest Lake, of the East Kootenay Power Company, which has here a stand-by plant operated by steam boilers, fired by pulverised coal, and intended to supplement their hydro-electric plants at Aberfeldie, on the Bull River, and at Elko, on the Elk River.

From the Crow's Nest Pass we proceeded westward to Kimberley, where we had one of the most remarkable experiences of the tour, being conducted through the workings of the famous Sullivan lead-zinc mine of the Consolidated Mining & Smelting Company of Canada, visited a fortnight previously by H.R.H. The Prince of Wales and his brother, Prince George. Here we indulged in Alpine climbing in great stopes large enough to hold a small cathedral and lighted up by searchlights. The mine has an extremely complex ore, and until some time during the war was of little value, owing to the difficulty of separation. The war crisis led, however, to successful research work, as the result of which this mountain has become the world's greatest lead and zinc mine. The ore brought out, after going through various stages of crushing in a mill, which takes it by gravity down to the track of the C.P.R., is transported in 68-ton cars to the great concentrator a few miles down the line. Here, in one of the best-designed plants to be found anywhere in the world, four thousand tons of ore daily—ultimately to be enlarged to six thousand tons a day—are treated to separate the intimately-mixed lead, zinc and iron sulphides. After very fine grinding, the ore goes to mechanically-agitated surge tanks, which feed the lead flotation machines, the reagents necessary for the lead separation—soda ash, sodium cyanide, coal-tar creosote, and water-gas tar having been added in the fine-grinding circuit. The first lead concentrate carries about 50% lead and 10% zinc. Cleaning machines bring this up to 65% lead and 5% zinc, the concentrates being filtered and sent to loading bins preparatory to shipment to the trail smelter.

Preparatory to the flotation of the zinc, copper sulphate is added to the tailing from the primary lead machines, forming the feed to the zinc machines. The

pulp, heated to 25° C., with added water-gas tar, proceeds to M.S. machines, which make a lead-zinc concentrate, a zinc concentrate, a zinc middling, and a tailings product. The first is put over Plato & Wilfley tables, making a lead-iron product, which is returned to the fine-grinding circuit, and also a zinc concentrate and a zinc-iron product. The tailings are classified to form a concentrate, and the zinc middlings from the flotation machines, together with the classifier concentrate and the zinc-iron middling from the tables, are reground in a Hardinge ball mill in closed circuit with a rake classifier, and are then retreated in a flotation machine, which produces a concentrate that goes back to the tables and a tailing which goes back to the zinc-roughing flotation machines. The zinc concentrate from the primary zinc flotation cells, added to that from the tables, is thickened in Dorr thickeners, filtered in American filters, and sent to bins for despatch to the smelter at Trail.

The following morning found us at Kootenay Landing, where the trains were taken on board ferries, whilst we, on the s.s. *Nakootin*, took a trip down Lake Kootenay, first to the Bluebell lead mine at Riondel, and in the evening landed in the rain at the city of Nelson—a very charming place in the sunshine, I believe. Dinner was enjoyed in the new buildings at Lower Bonnington Falls of the West Kootenay Power & Light Co., Ltd., after a visit to the hydro-electric power development at Upper Bonnington Falls, where 60,000 h.p. is generated for use at the mining, milling, and smelting plants of the Consolidated Mining & Smelting Company and other industries in the neighbourhood. The next morning we arrived at Tadoussac (Trail), doomed to devote two hours or thereabouts to the detailed examination of the greatest metallurgical plant in the British Empire, which my metallurgical confrères declare calls for no less than a month of concentrated study. The plant covers 250 acres, and includes a zinc smelter, a copper smelter, an electrolytic zinc-reduction plant, electrolytic lead and copper refineries, a gold and silver refinery for the "impurities" of the ore, a hydrofluoric and hydrofluosilicic acid plant, a sulphuric acid plant, a bluestone plant, a copper-rod mill, and many auxiliary plants.

Away then, jogging and bumping along the horse-shoe and hairpin bends of the Kettle Valley Railway, through the mountains to Princeton, from which station we proceeded on a train of observation cars to climb the 5000 ft. of Copper Mountain. Access to the mine on the summit was secured by a cable elevator hauled up the face of a cliff, giving the mining engineers of the Empire an excellent view of the gorge a mile below, where their careers would come to a sudden finish should anything happen to the slender wire rope upon which their lives depended. The concentrator, to which we returned late in the evening, has a daily tonnage of 2000 tons, and in 1926 some 669,306 dry tons was treated, containing 3985 oz. of gold, 137,480 oz. of silver, and 17,752,253 lb. of copper. The concentrate produced is sent for refining to the Trail smelter of the Consolidated Mining & Smelting Co., Ltd., though the copper mine and concentrator is one of the properties operated by the Granby Consolidated Mining, Smelting & Power Co., Ltd.

ESTABLISHED 1844

Cheaper Longer-Lasting Roads

Permanently proof against skids!

Considered solely as a durable, economical and practical road-surfacing material, British Tar is considerably in advance of any other material found on our roads to-day. Approved aggregates for use with British Tar are to be found in every part of the country. When properly laid, any one of these forms, with British Tar, a road cheaper to lay per super yard,

as economical to maintain, and as durable as any other road in existence.

But above all this, is the chief and especial virtue of British Tar; that it alone forms the slightly roughened surface that offers permanent non-skid protection to all motor traffic.

Write for full particulars.

We are exhibiting at the Public Works and Roads Transport Congress and Exhibition, 1927, Stand 60, Main Hall, and invite a visit from everyone interested in the use of Tar for Roads.

The Desiccation of Sugar Beet.

The SCOTT "PATENT" DRYERS described in this and preceding issue are the only successful Dryers in operation on Sugar Beet.

70-tons per day plant, 1926 and 1927 campaigns
100-tons per day plant, 1927 campaign.

These Dryers operated continuously throughout the campaigns, producing white dry coagulated cossettes suitable for sugar extraction, giving no trouble in the simplified treatment of the high density juices directly obtained.

The claims made for NO DESTRUCTION OF SUCROSE BY INVERSION OR CARAMELISATION, TOGETHER WITH COMPLETE COAGULATION OF ALBUMENIDS AND LOW FUEL CONSUMPTION have been tested and confirmed by independent and official experts and visitors to the factory from all parts of the world during the present season.

Low fuel consumption unapproached by any other design of dryer established by tests and weekly running figures.

*While of the greatest importance to the world interests of Beet Sugar Manufacturers, the De Vecchis Process is vital to all interested in the British Sugar Beet Industry in the face of the diminishing Subsidy.
No Royalties payable in Britain.*

This Patent Dryer is only one of the many specialised Scott designs. Submit your drying problems to us. Our unique experience is freely at your disposal.

From Copper Mountain we passed on to Vancouver and Victoria, where three very pleasant days were passed in recreation, apart from the short Vancouver technical sessions. In Vancouver also the writer had an opportunity of inspecting the operations at one of the great lumber mills, where huge Douglas fir or cedar logs 5 or 6 ft. thick were sawn up into planks and laths of every size and converted into panelled doors.

The steamer which brought us from Victoria to Vancouver made a détour up the Howe Sound to enable us to visit the concentrator of the Britannia Mining & Smelting Co., Ltd., beautifully situated on Britannia Beach. The plant, which has a daily capacity of 2500-3000 tons of ore, produced last year concentrate containing 9995 oz. of gold, 148,113 oz. of silver, and 30,954,479 lb. of copper, as well as iron pyrites, which is exported to sulphuric acid plants.

From Vancouver the Congress trains proceeded by the Yellowhead Pass into Alberta, where at Jasper we spent two most enjoyable days in the National Park, enjoying motor drives to Mount Edith Cavell and other points, hiking through the woods, golf, and other pleasant variations from the examination of ores and machinery. Again passing eastward through Edmonton, we detrained at Wainwright to see the oil and gas wells at that point. Here, up to the present, production has not reached the point at which it can be considered an economic proposition. Elsewhere in the province, however, natural gas is produced in large quantities and conveyed by pipe line for many miles to serve industrial plants and domestic consumers in places like Edmonton, Calgary, and the smaller towns. Gasoline is produced in the Turner Valley by chilling the natural gas, but one crude-oil well has been discovered.

From Wainwright our route took us by way of Saskatoon, Winnipeg, Fort William, Port Arthur, and Cochrane to Noranda, the centre of the new Rouyn copper-mining district of North-Western Quebec. Here, in what was three or four years ago a primeval forest reached only by aeroplane or canoe, the Noranda Company is building a new town and a smelter, which they expect to open before these lines appear in print. The Congress visited the new smelter in the morning of Sunday, September 25, and, incidentally, we had what must be the unusual experience of taking liquid refreshment in the interior of a reverberatory furnace. Provision is made in the plant for crushers in three stages; for eight ore roasters, two reverberatory furnaces, two Peirce-Smith converters, a copper refinery, a pulverised coal plant with eleven concrete storage silos for use in smelting operations, a Cottrell electrical precipitator, and a stack 422½ ft. high, 31 ft. in diameter at the base.

Our trains passed on from Rouyn, and after a night journey we reached Quebec, where after further technical sessions we entrained once more and travelled over the great Quebec Bridge to Thetford Mines, the centre of the asbestos country. Visits were made to the Black Lake, British Canadian, the Bell and other properties of the Asbestos Corporation of Canada, Ltd., and the mining and milling operations examined in some detail. The principal operations in the mill are the crushing of the ore and the mechanical screening and weighing of the various grades of fibre. The country is piled high with

mounds of waste asbestos sand, for which no economic use has yet been found.

The trains left Thetford on their last lap, reaching Montreal on Tuesday evening, and here the Congress Tour "A" came to an end, delegates separating some to return home to England, South Africa, or to some other distant corner of the world, and the writer to try in some measure to follow in the footsteps of Tour "B," and to see something of the power developments at Shawinigan Falls and Grand' Mère; the power, paper and aluminium works at the head of the Saguenay; and the collieries and steelworks at Sydney, Cape Breton Island.

Of these, undoubtedly the most remarkable is the immense concentration of energy at Arvida, in the Lake St. John district of Quebec, where cheap electrical power estimated to be capable of development up to 1,340,000 horse-power has justified the establishment not only of large pulp and paper mills and of a hydro-electric central station for the long-distance transmission of power, but of a plant which, with its accessories, will eventually cost about \$100,000,000, and is already engaged on the production of aluminium. At the moment the production of aluminium pig reaches only a million pounds a week, but when the new power plant at Chute à Caron across the river is completed with its ten great 80,000 h.p. generators, producing 800,000 h.p., the output of aluminium at Arvida will be 90% of the *present* world consumption. Production at the moment is from bauxite, previously dried and purified in American plants, but vessels are already coming up the Saguenay River bearing bauxite from British Guiana. These same boats will be taking out loads of wood pulp and paper produced at Port Alfred and elsewhere in this great forested district stretching hundreds of miles northward in the direction of Hudson's Bay.

At Shawinigan Falls I visited the two power plants of the Shawinigan Company, and the ingot, wire rod and wire mill of the Aluminum Corporation of Canada, as well as the calcium carbide plant of the Canadian Carbide Co. and the Laurentide paper plant at Grand' Mère.

Bringing my long journeyings to a close on the Atlantic coast, I paid visits to the famous No. 1-B submarine colliery of the Dominion Coal Company at Glace Bay, and ended up the day at the great ore and coal shipping pier, coke-ovens and steel works of the Dominion Steel Corporation, forming one of the subsidiaries of the British Empire Steel Corporation. This concern claims to derive quite an unusual proportion of its material from British territory, its coal coming from the Cape Breton mines; its limestone from local quarries; many of its firebricks are made in the plant; its iron comes from Bell Island, Newfoundland; and its fourteen ocean-going steamers, with a deadweight capacity of 70,000 tons, take steel products, sulphate of ammonia, and iron ore to Australia, New Zealand, Japan, Europe, South America, and the West Indies. The plant's capacity includes 580,000 tons of pig iron; 420,000 tons of steel ingots; 375,000 tons of blooms; 150,000 tons of billets; 240,000 tons of rails; 90,000 tons of wire-rods, wire, barbed wire, etc.; 60,000 tons of wire nails, fencing, etc. The sulphate of ammonia from the coke-oven plant is shipped almost entirely to the sugar plantations in Cuba and the West Indies.

above that it decided to put down for the 1927 campaign a larger machine to work alongside the first.

enter the lower drying chamber circuit prior to mixing with the re-circulated air in the circulating fan. Fig. 10

FIG. 9A

Band dryer for sugar beet

In order to minimise Customs charges, a portion of the material was provided in Italy to drawings sent out, but essential parts, such as fans, driving mechanisms, chains, control fittings, etc. were sent from this country. This plant is now erected and working. It is practically a duplicate of the earlier, except in several minor details which embody the results of experience with the earlier machine, the method of feeding the wet cossettes, the provision of a further drying band in the top drying chamber, and the use of oil fuel in the furnaces.

It is proposed to describe this machine in rather more detail. Figs. 9, 9A and 9B show an elevation of the complete machine, excluding the oil furnaces—these come on the right-hand end of the machine—and also an end elevation looking from the feed toward the furnace end. It also shows a section through the main flue showing five of the butterfly dampers controlling the flow of the hot furnace gases into the circulating gas passing through the upper drying chamber, and also the mixing chamber, wherein fresh atmospheric air and hot furnace gases

FIG. 9B

Band dryer for sugar beet

shows a section through the two drying chambers and a cross-section through the machine showing drying

chambers, flues, and a small section of the feed, elevator, etc.

DRYING CHAMBERS

The drying chambers measure approximately 49 ft. long by 9 ft. wide. The walls are of concrete slabs filling in the space between the steel members of the framing. Hinged double-walled steel doors at each end of the machine give access to the interiors and a series of doors midway along one side give access to the chambers, bands and chain.

DRYING BANDS

Four endless drying bands are provided in the top chamber and two in the lower or coagulating chamber. Each consists of a number of stout wire panels hinged together and attached to the endless band chains provided for moving the bands. These chains run on steel bars and pass over chain sprockets at each end

air is kept in constant circulation through the top drying chamber by the six large propeller fans directing the air horizontally over the full length of the chamber and through openings approximately half-way up the inner wall. Hot furnace gases from the main flue are gradually mixed into the air in circulation, this supply of furnace gases being regulated by the six pairs of butterfly dampers indicated. Part of the air is exhausted constantly through a pre-determined section of the top drying band by the main withdrawing fan placed on top of the dryer. The exhaust to atmosphere is through the Venturi shape exhaust head. The butterfly dampers are connected by adjustable rods to the control panel, and are operated from that point in accordance with the temperatures registered by electric resistance thermometers placed in the paths of the re-heated circulating air. One thermometer is provided for each circulating fan. The Cambridge indicating instrument giving the

Fig. 10

Band dryer for sugar beet

of the machine. The driving shafts of the four top bands are coupled together by external driving chains and a double worm reduction gear box provided with a four-step belt pulley taking its drive from a similar pulley on a countershaft. The two bands in the lower chamber are also coupled together and to a similar double worm reduction gear. The bearings carrying the band chain sprocket spindles are placed outside the drying chambers, and special arrangements are provided for adjusting the working tension of the band chains. Beet cosettes are kept out of contact with the band chains by suitable protecting plates, and the beet is directed in its fall from band to band by steel deflecting plates arranged in the ends of the machine.

AIR CHAMBERS, FLUES, AIR CIRCULATION, CONTROLS, ETC.

The arrangement of the air chambers, flues, etc. will be clear from the cross-sectional view in Fig. 10. The

temperatures of all the thermometers is mounted on the control panel, which also carries a draught gauge indicating the pressure in the main flue and a differential gauge recording the difference in static pressure at the throat and outlet of the Venturi discharge head.

The fan for circulating the air continuously through the bottom drying chamber is shown on the left-hand side of the front elevation in Fig. 9, and the withdrawing fan shown on the right-hand side just above the extended main flue. The air is re-heated, before entering the circulating fan, by the admission of hot furnace gases from the main flue through two horizontal ports into the mixing chamber indicated in the part of the sectional elevation in Fig. 9b. It will be remembered that cold air is also admitted into the suction of this fan, and this passes through the rotary damper partly shown in the same view. These dampers are regulated by adjustable rods from the control panel, according to the indications of an electrical resistance thermo-

meter. The heated air is delivered below the bottom band and passes upwards through the bands and two layers of beet cossettes thereon. The air from the furnace end of the machine is withdrawn through a steel grid and returned to the main flue by the withdrawing fan, whilst the remaining air returns to the circulating fan.

Wet and dry bulb thermometers, also of the electrical resistance type, are placed in the air passages leading from the top of the dryer to the main withdrawing fan. In addition, certain other points of the machine are wired to the indicating instruments, so that temperatures can be taken in various parts of the machine by movable thermometers with plugging connexions. The operator can thus (without moving from the control panel) ascertain the air temperatures in various vital parts of the machine, and can alter these temperatures by regulating the necessary dampers. He also knows the draught conditions in the main flue, has a measure of the amount of air leaving the dryer from the reading of the differential draught gauge, has an indication of the hygrometric state of the air leaving the machine by the readings of the wet and dry bulb thermometers, and can make the necessary adjustments to obtain the best conditions. He has under his control, therefore, the complete working of the plant, apart from the feeding of the wet material. He is also in close touch with the firemen operating the furnaces.

During 1926 the operator recorded these various temperatures, the readings of the draught gauges and the ampère meters carried on panels alongside the control panel, and also recorded the weight of wet beet fed into the machine. For part of the season readings were taken every half hour, and for the remainder of the season every hour, and this season it is anticipated that the one operator will control the 100- and 70-ton machines and register the temperature readings etc. It is thus possible to trace any alteration in the operation of the plant and to vary the instructions given to the operator in accordance with the drying results obtained.

Given correct wet and dry bulb readings and reliable readings of the differential gauge registering difference in static pressures in the throat and enlarged sections of the Venturi head, it should be possible to obtain at any moment the approximate volume of wet air leaving the machine and the weight of water vapour contained therein. The arrangements of the machine did not permit of accurate results being obtained, but the provisions made gave valuable indications of the performance of the machine when starting up the plant in the first place. The readings also enable the operator to ensure that a correct volume of air is leaving the plant to give the best drying results and to ensure that the air is saturated as fully as possible. To correlate the readings of the wet and dry bulb thermometers and the differential draught gauge, the psychrometric chart (Fig. 3) and the curves in Fig. 12 were used. From the psychrometric chart the wet and dry bulb thermometer readings enable the dew point to be determined, and this defines the relative weights of water vapour and dry air in the mixture. By assuming that the density of the mixture as discharged is the same as the density of the same mixture at the dew point, and knowing the areas

of the throat and enlarged section of the Venturi head and the differences in pressure, all the data are provided for determining the volume of wet air discharged and the weight of water vapour contained therein. The volumes, in cubic metres per minute and the weight of water vapour in kilos per hour for one millimetre reading of the differential gauge are plotted in Fig. 12. To correct the results thus obtained the volumes and weights are multiplied by the square root of the differential gauge reading. The wet and dry bulb thermometers, the differential gauge reading, and the charts therefore provided a very valuable indication of the performance of the machine at any particular moment.

PASSAGE OF BEET THROUGH DRYER

The wet cossettes are transferred from the cutting machines to the 70- and 100-ton dryers by a scraper conveyer, provision being made to give a rough division of the beet for the two machines. They drop from the

FIG. 12

conveyor into a hopper, one side of which is formed by an inclined elevator band made of light steel sheets hinged together and running over cast-iron spiders fitted to the top and bottom shafts and fitted with light steel lifting angles. This elevator is driven through belt and chain gear from the main countershaft. A variable reduction gear forms one link in the power transmission, thus permitting the speed of the elevator to be adjusted to suit the particular feed desired. The beet is discharged over the top of the elevator feed into an automatic, intermittently revolving feeder working inside a cast-iron casing and delivering beet into the dryer chamber in such a manner as to minimise leakage of air into or from the dryer.

This feed roll and feed elevator are directly coupled together for driving purposes, the speeds of both being controlled by the variable speed reducing gear. The wet cossettes drop from the feed roll on to the top drying band travelling thereon to the other end of the drying chamber, where they are discharged on to the second or

next lower band. In this manner the cossettes travel four times the length of the top drying chamber on the four bands provided before being discharged through the continuously revolving feed roll on to the top band in the lower drying or coagulating chamber. The cossettes are almost completely dry on entering the lower compartment, and the drying is completed on the top band in that compartment. The second and lower band runs at a much slower speed than the other five bands, and is specially provided for subjecting the dried cossettes to the coagulating temperature for the requisite period. The dried and coagulated product is discharged from the dryer by means of a screw conveyor through an air lock, and is delivered to the cossettes store.

It is not possible within the limits of this paper to describe fully all the mechanical details of the dryer, but probably the particulars given cover most of the important features. The design has been patented by the manufacturers.

DRYING RESULTS

At the moment full details of the running of the 100-ton machine are not available. Particulars of the early running taken from the log book have reached this country, but have not been completely analysed. Commercially, however, the results are quite satisfactory. Both machines are at work producing very satisfactory cossettes from a crop which, for Italy, is exceptionally high in sugar content. The fuel consumptions are extremely low, and there is no trouble from unconsumed fuel oil being carried forward to the cossettes from the burners. The cossettes answer satisfactorily the very delicate chemical tests used in the laboratory for determining the completeness or otherwise of the coagulation.

COMPARISON WITH OTHER SUGAR BEET DRYERS

Various other types of dryers have been used for drying the sugar beet cossettes, mostly in Italy. In an earlier part of this paper the greatly increased air circulation in the present machines as compared with the Loreo dryer (described in the White Paper) is referred to. This increased circulation is essential for a high thermal efficiency.

Another important difference between the "Scott" dryers and the earlier Loreo dryer is the form of the drying bands. The Loreo bands were constructed of a number of narrow steel plates with the ends turned over to form a hinged joint and connecting with the adjoining panels. These plates were perforated with a number of 3 or 4 mm. diameter holes, giving an approximate combined area through the bands for the passage of the air of from 16% to 28% of the whole band area. With the special wire panels described the area through the panels amounts to 47%. Further, small fragments of beet worked their way into the hinges of the plate panels, thus deforming and finally destroying these joints. No such trouble was experienced with the wire panels.

In the modified Loreo dryer considerable difficulty arose due to the Italian chains not being of equivalent quality to the English chains used at Sanguinetto. Also the air circulation provided, although greatly increased over previous practice, was not of the same order as at

Sanguinetto. Actually, the circulation in the "Scott" dryers is very much greater than the circulation provided in any other design of dryer used in this particular work.

At another Italian works a large German rotary dryer was put to work for the drying of beet cossettes, but even after two years' experimental running it has not been possible to produce from this machine satisfactorily coagulated cossettes. The drying appears to be quite complete, but the cossettes do not satisfy the coagulation tests, and are not satisfactory for sugar extraction.

From the arguments put forward earlier, it will be clear that very large air passages are necessary to give the amount of re-circulation required to permit of a low initial temperature in contact with the beet and give a low fuel consumption. It is not possible to give such areas through any reasonable size of cylindrical dryer except by greatly increasing the power used due to the high air resistance resulting from the higher velocities. In the Sanguinetto dryers it will be recalled that the air is passing both vertically up and down through the top drying chamber through cross sectional areas of approximately 360 sq. ft. Part of these areas are, of course, taken up by wires and hinges of the bands and the beet resting on the bands, but even making all possible allowances, the dimensions of an equivalent rotary dryer would be excessive.

It is therefore necessary, with the rotary type of dryer used, in order to obtain a reasonable fuel efficiency, to have a high initial temperature in the air in contact with the beet. In the German dryer the initial temperature decided upon was about 500° C., and in order to minimise the effect of this heat on the beet the hot gases entered with the wet beet. A number of different devices were used in conjunction with this dryer in order to obtain the desired coagulating conditions, but up to the moment without success.

CANADIAN INDUSTRIAL NOTES

The British Columbia Electric Railway Co., Ltd., is extending its gas plant at Vancouver, B.C., by the erection of a gasometer of 3,000,000 cu. ft. capacity, and gas-producing installation having a daily output of a similar amount. This is the first unit to meet the increased demand for gas, and will probably be shortly followed by another unit. The total value of the first unit is estimated at \$650,000. John Keillor, gas engineer of the company, has left for England, where the plant will be constructed.

The Canadian Paperboard Co., Ltd., has purchased a site on the waterfront at Toronto, and will erect the first unit of a mill, costing over \$1,000,000. The company will use about 1500 h.p. of electric energy obtained from the Ontario Hydro-Electric. The company has three mills operating at present on cardboard and pulp—Montreal, Quebec; Frankford and Campbellford, Ontario.

The revised statistics for 1926, issued by the Dominion Bureau of Statistics, show that the cement production was the highest ever attained in the country, being 7.2% higher than in 1926. The output was 9,041,411 bbls. Imports of cement amounted to 21,114 bbls., valued at \$77,866, whilst the exports were 285,932 bbls. The selling price of cement was slightly lower during 1926 than in the previous year.

HARRISON MEMORIAL LECTURE: PRESENTATION OF MEDALS

On November 8 a Harrison Memorial Lecture was delivered in the theatre of the Pharmaceutical Society by Mr. A. Saville Peck and Harrison Memorial Medals were presented to Mr. Peck and to Mr. Francis H. Carr, C.B.E., President of the Society of Chemical Industry.

In his lecture Mr. Peck paid tribute to the services given by Harrison to the cause of pharmacy and outlined the part he played in the discussion which eventually led to the amalgamation of the Pharmaceutical Conference with the Pharmaceutical Society. Speaking of Harrison's advocacy for the inclusion of biochemistry in pharmaceutical examinations, the lecturer said that pharmacy was not keeping pace with recent developments in biochemical methods. The newer animal products, with few exceptions, found no place in the Pharmaceutical Society's curricula, whereas vegetable drug treatment, except where of proved value, tended to decline. He concluded by advocating the establishment of a post graduate course in pharmacy.

After a vote of thanks to Mr. Peck had been passed, the chairman, Mr. H. Skinner, said that the lecture they had heard was the first, though in practice it was the second. Originally a prize was instituted for the pharmacist of not over five years' standing who contributed the best paper for the advancement of pharmacy and chemistry, but the response was unsatisfactory and the trustees established a Memorial Lecture to be given bi-annually, and decided that the first medal should be awarded to Mr. Carr, who gave the first memorial lecture. Mr. Carr was very well known to many of them, and he remembered that when he gave his memorial address on Harrison it was one of the finest things they had had in that lecture theatre. Handing then the medal to Mr. Carr, the Chairman said nothing could give him greater pleasure than to be able to hand him a replica of the medal and of the plaque; he trusted it would always remind him of a very dear friend.

Mr. Carr took the medal amid great applause, and replied that it was a very happy thought and a very gracious act that when instituting this lectureship on the new basis they should have given this medal in recognition of an address he gave there some year or less after Harrison's death. It added to the debt of gratitude he owed to the Pharmaceutical Society. It was some thirty-six years ago, when a boy of nineteen, that he first was introduced to pharmacy. It was in those laboratories that he devoted himself to what had been the greatest pleasure of his life, and there it was that he first met the man whom they had met to-night to honour. He was the first man he met when he came there, and he had exerted as powerful an influence on his life as his coming to that society did, an influence not only on his practical life but on his insight into character. For Harrison was first and foremost a man of character. He set an example which could help and had helped all who came in contact with him. He thanked them very cordially for the gracious act of presenting him with the medal.

Subsequently the Chairman presented another medal to Major Peck for the lecture delivered that evening.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

LIST OF MEMBERS ELECTED

November 11, 1927

- Aeschlimann, John A., bei Firma Hoffmann La Roche & Co., A.G. Basel 2, Switzerland. Chemist.
- Ball, Colin B., 104, Tottenhall Road, Wolverhampton, Assistant Works Manager.
- Beilensohn, Bernard, Heaton Cottage, 94, Bury Old Road, Higher Crumpsall, Manchester. Chemist.
- Brock, Raymond B., West Hill Cottage, Oxted, Surrey. Chemist.
- Connor, Dr. Robert J., The Woodlands, Crescent Road, Crumpsall, Manchester. Research Chemist.
- Dickson, John B., c/o A. G. Spalding & Bros., Chicopee, Mass., U.S.A. Director of Research.
- Freudenberg, Dr. Karl, Chem. Institut, Akademiestr. 5, Heidelberg, Germany. University Professor.
- Liang, C. L., Chemistry Department, Tsing Hua University, Peking, China. Lecturer.
- Lloyd, Dr. Dorothy J., The Lister Institute, Chelsea Gardens, London, S.W.1. Director of the British Leather Manufacturers' Research Association.
- Nave, Geo. M., 94, Park Road, Wallsend-on-Tyne. Analytical Chemist.
- Parry, John, The Laboratory, De Beers Consolidated Mines, Ltd., Kimberley, C.P., S. Africa. Analytical Chemist.
- Riding, Richard W., 17, Victoria Terrace, Ditton New Road, Widnes. Research Chemist.
- Robinson, Edwin B., 5, Wilfred Street, Moston, Manchester. Chemist.
- Simmons, William C., Geological Survey of Uganda, P.O. Box 9, Entebbe, Uganda, E. Africa. Petrologist and Chemist.
- Staley, Godfrey A., 74, Lansdowne Road, Tottenham, London, N.17. Chemist.
- Vickers, A. Eric J., 27, Lily Street, Wolstanton, Stoke-on-Trent. Chemist.
- Watts, Gordon E., "The Woodlands," Crescent Road, Crumpsall, Manchester. Chemist.

BRISTOL SECTION

At the meeting on November 3, a paper was given by Mr. H. R. S. Clotworthy on "The manufacture of viscose artificial silk."

Mr. Clotworthy first outlined the general principles of the manufacture of all types of artificial silk. Cellulose is treated by chemical means whereby it is brought into a homogeneous solution. This solution is then forced through fine orifices into a suitable liquid or heated air, in which the thin jets of liquid are coagulated, and the solid filaments thus formed are wound off continuously as produced.

The viscose process was then described in detail. The raw material generally used is woodpulp in the form of sheets. These sheets are immersed in a solution of caustic soda of mercerising strength, which causes the cellulose fibres to swell. The excess of caustic soda is pressed out, and the resulting solid mass of cellulose and caustic soda is disintegrated in specially-constructed machines until it is obtained in a fine flocculent form. The material, termed alkali-cellulose, is stored in bins at a constant temperature for several days to mature. In the maturing process the cellulose undergoes a change in molecular structure, and this change has an important

bearing on the viscosity of the cellulose solution ultimately obtained. After maturing, the alkali cellulose is treated with carbon bisulphide in revolving vessels. The carbon bisulphide re-acts with the alkali cellulose, forming cellulose xanthate, a solid dough-like substance of an orange colour, which is dissolved in a solution of caustic soda. The resulting solution, called viscose, is the material from which the silk is spun. Before spinning, however, this viscose is filtered very carefully and ripened at a constant temperature until it is ready for spinning.

In the spinning process the viscose solution is forced by pressure through jets containing 20 or more minute holes. These jets are immersed in a liquid which may contain a variety of substances, but the main components of which are sulphuric acid and sodium sulphate. The 20 or more fine streams of liquid issuing from the jet immediately solidify on coming in contact with the sulphuric acid, the solid filaments so formed are passed over a continuously-revolving drum and into a box rotating at high speed, thus being twisted together into a compact thread which is deposited on the inner surface of the rotating box, and gradually builds up on the inside of the box in the form of a cake.

The cakes of thread are removed at intervals, and the thread is wound off into hanks. These hanks are washed to free them from sulphuric acid, dried under tension, then treated with a solution of sodium sulphide to remove sulphur, and after bleaching are washed and dried. The hanks are then wound on to bobbins for hosiery manufacturers or on to pins for wearing.

Mr. Clotworthy dealt with the methods of ensuring uniformity of the yarn, and the problems to be faced in handling artificial silk due to its unique physical properties.

The lecture was illustrated by specimens showing the various stages of manufacture, kindly lent by the Western Viscose Silk Mills, of Bristol, and by lantern slides, many of which were supplied by Messrs. Dobson & Barlow Ltd., of Bolton.

GLASGOW SECTION

A meeting was held on November 9 at the Institution of Engineers and Shipbuilders, Glasgow, when a paper on "Research in the textile industry" was read by Mr. C. M. Keyworth, M.Sc. The chairman of the section, Mr. S. H. B. Langlands, presided.

The lecturer, introducing his subject, said that the best way of meeting the ever-increasing demands of an industry was to utilise the results obtained from research work. The textile industry was no exception, and textile technology had become an exact science. Attention was drawn to the fact that in the linen, woollen and worsted, and cotton and silk industries scientific investigation was now recognised as essential for the future welfare of these industries. With the financial assistance of the Department of Scientific and Industrial Research, associations had been formed in these industries.

Each association had its own technical officers, who were investigating the fundamental problems associated with the industry. Valuable academic information had been already obtained, and much of it had been put into actual practice.

A review of the work accomplished by these associa-

tions was given, and many interesting lantern slides were shown.

The chairman, who opened the discussion, paid a tribute to those who, by individual enterprise and experiment, had fostered the linen industry in Ireland.

Mr. Findlay, speaking more particularly on the problems associated with the cotton industry, referred to the detailed abstracts of the research work conducted in all countries. These abstracts were prepared by the officers of the respective associations, and were issued to all the members. He also mentioned the valuable work which had been done upon the composition of the wax constituents of the fibre. Utilising such information, it was possible to state from which country a particular sample had come. The composition of the wax differed according to the conditions under which the plant had been grown.

Mr. Nuttall referred to the difficulties with regard to specifications for cotton and to the occurrence of "dead" cotton in cloth.

Amongst the others who took part in the discussion were Messrs. MacCallum, Chapman, Jamieson, Gunn, and McArthur. On the motion of the Chairman, a vote of thanks was accorded to the lecturer.

SOUTH WALES SECTION

A meeting was held at the Technical College, Cardiff, on November 1, when Mr. T. Lewis, Ph.C., read a paper on "The care of the eyes in industry."

The lecturer treated the subject under three heads: (i) Hygiene, (ii) Accidents and preventive measures, (iii) Standards of vision and their effect on the efficiency of the worker. Under the first heading he dealt with types of lighting and the conditions which should be avoided. The best type of light was one which approached the yellow of the spectrum, whilst indirect lighting was better than direct from the point of view of the worker. Devices for the homogeneous distribution of light were discussed, and the lecturer suggested a minimum of 3 candle feet of light in the plane of the work for ordinary operations, and of 5 candle feet for fine work. He then dealt with the causes and prevention of nystagmus.

Under the second heading the lecturer defined the limits to which first aid should go in dealing with minor accidents to the eye. He then discussed the methods of rendering first aid, and dealt particularly with injury by acids, alkalis, and steam. Many eye accidents were avoidable by the use of proper goggles, but it was a common practice to fit flat, badly-annealed window glass to goggles, with the result that they were very trying to the eye; the necessity was emphasised for fitting proper meniscus lenses of no power. The prevalence of cataract amongst glass, iron and lead workers was then dealt with.

Under the third heading the necessity was emphasised for adopting a standard of vision for those who proposed to enter certain types of industry. At the present time little or no attention was paid to this important factor in industrial efficiency and safety. Many workers used only one eye, with consequent inability to appreciate depth of focus, others were colour blind. Workers with these defects were a potential source of danger in many industries.

The lecturer concluded by discussing the causes and prevention of blindness due to accidents in industry, and mentioned the peculiar properties of certain nitro-compounds in this connexion. Of all the blind persons in this country, including infants, no less than 7.5% was due to industrial accidents, and nearly all of these could probably have been avoided by the use of properly fitting goggles.

CALENDAR OF FORTHCOMING EVENTS

Nov. 18.—**Society of Chemical Industry, Chemical Engineering Group.** Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "Some modern methods of recovery of lubricating oils," by A. J. Broughall.

Nov. 18.—**Society of Chemical Industry, South Wales Section.** Jointly with the Institute of Chemistry, at Thomas's Cafe, High Street, Swansea, at 7.30 p.m. "The engineer-chemist and his influence in engineering economies," by G. E. Hider.

Nov. 18.—**Society of Chemical Industry, Liverpool Section.** Jointly with the Liverpool and North Western Section of the Institute of Chemistry. The University, Brownlow Street, Liverpool, at 6 p.m. "Modern improvements in petroleum refining," by A. E. Dunstan. A cinematograph film will be shown illustrating the petroleum industry in Persia.

Nov. 21.—**Chemical Industry Club, 2, Whitehall Court, London, S.W.1,** at 8 p.m. "A chemist's view of evolution," by Prof. J. C. Drummond.

Nov. 21.—**Royal Society of Arts, John Street, Adelphi, W.C.2,** at 8 p.m. *Cantor Lecture I.* "Alloy steels: their manufacture, properties and uses," by Prof. H. C. H. Carpenter. (Also on November 28.)

Nov. 22.—**Institution of the Rubber Industry, Scottish Section.** Caledonian Hotel, Edinburgh, at 7.30 p.m. "Relation between the cotton and rubber industries," by R. Truesdale.

Nov. 22.—**Armourers and Brasiers Company, Royal School of Mines, South Kensington, S.W.,** at 5.15 p.m. "X-rays and metals," by G. Shearer.

Nov. 23.—**Textile Institute, London Section, 38, Bloomsbury Square, W.C.1.** "Some laundry problems," by J. R. Peers.

Nov. 23.—**Royal Society of Arts, John Street, Adelphi, W.C.2,** at 8 p.m. "Malayan varnish resins," by T. H. Barry. (Lantern lecture.)

Nov. 23.—**Faraday Society.** Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 2.30 p.m. General discussion on "Cohesion and related problems."

Nov. 24.—**Chemical Society, Burlington House, Piccadilly, W.1,** at 8 p.m. "Gaseous combustion at high pressures," by Prof. W. A. Bone, F.R.S.

Nov. 24.—**Society of Chemical Industry, Birmingham and Midland Section.** The Chamber of Commerce Buildings, Birmingham, at 6.45 p.m. "Notes on the chemistry and physics of stone decay and preservation," by A. R. Warnes.

Nov. 24.—**Institution of the Rubber Industry, Manchester and District Section.** Bleachers' Association, Blackfriars Street, Manchester. "Artificial silk and its uses in the rubber trade and possible lines of development," by Major A. B. Shearer.

Nov. 24.—**Institute of Brewing, Midland Counties' Section.** White Horse Hotel, Congreve Street, Birmingham. "Science and practice in the malt house," by Prof. A. R. Ling.

Nov. 25.—**Society of Chemical Industry and Institute of Chemistry, Edinburgh and East of Scotland Sections.** Social evening. Party at the Palais de Danse, Edinburgh, at 8 p.m.

(See also p. 1089)

CORRESPONDENCE

COMFORT AND SUGAR

SIR,—Your interesting article on "Comfort and fertilisers" reminds me of a problem which has often puzzled me. How on earth did people manage without sugar, *i.e.*, cane sugar. Except honey, was there any other form available? May I hope this may be the subject of a future editorial?

Yours sincerely,

GEORGE J. WARD

"THERMS"

SIR,—Your correspondent's commentary on this subject might have gone a step further, to a practical conclusion, as the matter does not end with the comparative cost to the user of the various power media. The prices quoted presumably represent a considered average for a given district at the user's premises, apropos of which one might expect the electricity lines to be in existence, so that the cost of erection does not arise. One might also wonder why those fortunate people who can obtain coal at 3d. per therm and gas at 7d. per therm, cannot get electricity at less than 29d. per therm.

However, it will generally be conceded that electrical power is the most flexible and efficient form for use in the majority of works, and accordingly, whichever form of fuel is employed for the mechanical power generation, electricity will be the medium for the final power distribution.

Therefore, taking average efficiencies of coal-steam-electric, Diesel-electric, and gas-electric power generation on the average medium works scale at 7%, 33% and 28% respectively, the relative costs per therm, neglecting labour, maintenance, etc. charges, are:—Coal, 10.7d.; oil, 8.35d.; and gas, 25.35d.

The labour, maintenance, and overhead charges in the aggregate are proportionately much higher for small than for large stations, and one may reasonably assume that, if a large steam-electric power station with an overall thermal efficiency of 18–20% cannot generate and distribute electricity at less than 1d. per kw.-hr., a much smaller generating unit in the same locality cannot be expected to do any better, even when allowing for extra capital charges and distributing losses in the case of the former.

Summarily, it would appear that for the power requirements of the average medium-sized works, fuel oil, electricity, coal, and gas would be the probable order of ascending costs for "useful 'therm'" distribution on the basis of the figures quoted, the actual relative position of coal depending on the degree to which exhaust or "bled" steam from the power plant can be used.

In conclusion, is it too much to expect that finely-divided coal particles will replace fuel oil in a modified Diesel-type engine, with a similar thermal efficiency?

Yours faithfully,

E. W. WIGG

PERSONAL AND OTHER ITEMS

The Academy of Sciences at Stockholm has decided to divide the Nobel Physics Prize for 1927 between Prof. A. Compton, of Chicago, for his discovery of the Compton effect, and Prof. C. T. R. Wilson, of Cambridge, for his

method of investigating the movements of electrons. The Nobel Prize for Chemistry is not to be awarded until next year.

At the anniversary meeting of the Royal Society on November 30, the following were recommended by the President and Council for election to the Council:—*President*, Sir Ernest Rutherford; *Treasurer*, Sir David Prain; *Secretaries*, Mr. J. H. Jeans and Dr. H. H. Dale; *Foreign Secretary*, Sir Richard Glazebrook; *Other members of Council*, Dr. E. D. Adrian, Sir Hugh Anderson, Dr. F. W. Aston, Dr. F. A. Bather, Sir Archibald Garrod, Sir Thomas Heath, Prof. A. Lapworth, Prof. J. C. G. Ledingham, Prof. F. A. Lindemann, Mr. J. E. Littlewood, Mr. C. Tate Regan, Prof. A. C. Seward, Prof. G. Elliot Smith, Dr. T. E. Stanton, Sir Gilbert Walker, Sir James Walker.

The following Ph.D. degrees have been awarded by the University of London:—in physical chemistry to H. F. Gilbe, F. E. King, and F. K. V. Koch; in organic chemistry to S. R. Husain; in chemistry to C. H. Johnson; in biochemistry to L. P. McGuire; in agricultural chemistry to C. E. Marshall.

The late Alderman George Edward Wilson, J.P., a director of Albright & Wilson, Ltd., left £144,914, with net personalty £129,545.

The late Dr. W. H. Sodeau, M.I.Chem.E., left £6465, with net personalty £6423.

Rubber Industry Bill

The Government grant to the Research Association of British Rubber and Tire Manufacturers will come to an end in 1929, and the Rubber Industry Bill, introduced in Parliament this week, with the support of leading members of all the political parties, provides that thereafter funds shall be raised for the research work by collecting 1-25th of a penny on every pound of raw rubber that is retained for use in Great Britain. On an estimated consumption of 40,000 tons of rubber a year, this would bring in an annual sum of £15,000, and the principle of the scheme has the support of every trade association concerned and of 70 individual rubber manufacturers, representing a capital of £44,000,000 out of the estimated total capital of £50,000,000 in the industry.

Beet Sugar Subsidy in Parliament

In a written reply to Sir F. Wise, Mr. Guinness stated that, in accordance with the provisions of the British Sugar (Subsidy) Act, subsidy is paid to the manufacturers of home-grown beet sugar and molasses and not to beet growers. The total subsidy paid to manufacturers from April 1, 1927, to November 5, was £744,148 18s. 2d.

Advisory Committee on River Pollution

The Minister of Health and the Minister of Agriculture and Fisheries have appointed a Joint Advisory Committee to consider, and from time to time report on the position with regard to the pollution of rivers and streams, and on any legislative, administrative, or other measures which appear to be desirable for reducing such pollution. The membership of the Committee is as follows:—Sir Horace C. Monro, K.C.B. (chairman); A. R. Atkey, Esq., J.P.; Rear-Admiral T. Beamish,

C.B., R.N., M.P.; R. Beddington, Esq.; H. E. Brooks, Esq.; J. T. Conroy, Esq., D.Sc.; S. Easten, Esq.; C. N. Hooper, Esq.; F. E. W. Howell, Esq.; L. H. Lewis, Esq., M.I.C.E., M.I.M.E.; W. Prescott, Esq.; Lieut.-Col. D. Watts-Morgan, C.B.E., D.S.O., M.P.; and H. Maclean Wilson, Esq., M.D., B.Sc.

Safeguarding of Key Industries: Calcium biphosphate (Baking Powder quality)

The Board of Trade have received a complaint under Section 1 (5) of the Safeguarding of Industries Act, 1921, that calcium biphosphate (baking powder quality) has been improperly excluded from the list, H ii, of articles chargeable with duty under Part I of that Act, as amended by Section 10 of the Finance Act, 1926. The complaint will be referred for arbitration to a tribunal constituted under Section 10(4) of the Finance Act, 1926, and the date of the hearing will be announced shortly.

Any communications should be addressed without delay to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, London, S.W.1.

Coal by-products in Germany

The Acting British Consul-General at Cologne informs the Department of Overseas Trade that the *Deutsche Bergwerks Zeitung* of November 4 states that the demand for raw tar is quite good, although lower prices are being offered and paid, in accordance with the general position of the tar market, which is showing a downward tendency. There is no doubt that the demand and sales in pitch are declining, partly owing to the fact that road-making has ceased, and especially owing to the decline in the manufacture of briquettes. Not only in Germany, but in all countries where coal is exploited and briquettes are produced, complaints are made about the shortage in briquettes sales. This is probably due in part to the price of briquettes, but also because a large proportion of fine coal is used for dust firing, which has been increasingly employed since the beginning of the year. The consumption of pitch has greatly decreased. As a result, prices of pit coal pitch have fallen and prices for pit coal-tar oil are also showing a downward tendency, in spite of a brisk demand.

The I. G. and Synthetic Rubber

It is reported in the German Press that the I. G. Farbenindustrie has developed a process for the manufacture of synthetic rubber, which has so far passed the experimental stage that large-scale production may be anticipated. A director, Herr von Weinberg, is stated to have said that the cost of production had been brought so low that synthetic rubber could compete with the natural product. Information from another source, however, seems to imply that the experimental stage has not yet been completed, and that commercial production is hardly probable at present.

World Output of Fixed Nitrogen

The report of the British Sulphate of Ammonia Federation for the year ended May 31, 1927, shows that the production of fixed nitrogen declined from 1,333,700 tons in 1925—26 to 1,237,500 t. in 1926—27, owing to a decrease in the output of Chile nitrate, though some compensation was afforded by the increases of other

nitrogen products, as will be seen from the following table (in which Japanese cyanamide is included under synthetic ammonium sulphate and industrial ammonia liquor is included under "other forms") :—

	1926-27	1925-26
	Tons	Tons
By-product ammonium sulphate	303,200	296,700
Synthetic ammonium sulphate	300,000	289,200
Cyanamide	180,000	150,000
Nitrate of lime	81,000	30,000
Other forms of synthetic nitrogen	133,400	120,700
Other forms of by-product nitrogen	40,300	47,700
Chile nitrate	199,600	309,400
Total	1,237,500	1,333,700

Consumption increased by just over 4% (compared with 10% in the previous 12 months), the total amounting to 1,312,700 t. pure nitrogen (1,258,500 t.).

Russian Potash Deposits

Operations are shortly to be commenced on the potash deposits at Ssolikamsk, the geological investigation having been completed. Further deposits have been found at Beresnjakowo, in the same district.

COMPANY NEWS

BORAX CONSOLIDATED, LTD.

An interim dividend of 6d. per share (2½%) has been declared, less tax at 4s., on the deferred ordinary shares in respect of the year ended September 30, 1927, compared with last year's interim of 3½% (9d. per share).

ALLEN-LIVERSIDGE AND CO., LTD.

A dividend has been declared at the rate of 6½% annum (less tax) for the six months ended October 31, 1927, on the preference shares.

BUELL COMBUSTION CO., LTD.

The directors announce that negotiations have now been completed for the sale of the foreign rights of the Buell patents, the purchase consideration being a substantial sum in cash, and the retention of practically a-half interest in any profits obtained in any of the countries covered by the various patents. An agreement has also been entered into with powerful shipping interests, whereby Buell patents will be immediately put into operation on marine boilers for use on ships.

Forthcoming Events—contd.

Nov. 23 and 24.—Institute of Fuel. Autumn Meeting Rooms of the Institution of Electrical Engineers, Savoy Place, Victoria Embankment, W.C.2. On Nov. 23, at 10.30 a.m., a general meeting will be held, followed by the Presidential Address by the Rt. Hon. Sir Alfred Mond, Bt. The following papers will be presented and discussed :—(1) "National electricity supply—better utilisation of our fuel resources," by Sir P. Dawson. (2) "Operating experience of steam production at 1300-lbs. pressure," by J. Anderson. At 2.30 p.m., papers will be read as follows :—(1) "Measurement of steam flow in works' practice," by T. Nordenson and H. C. Armstrong. (2) "Preheated air for boiler furnaces," by P. H. N. Ulander. On Nov. 24, the morning session will commence at 10 a.m. with papers as follows :—(1) "The British coking industry and some of its products," by R. Ray. (2) "Vertical intermittent chamber ovens," by N. J. Bowater. (3) "Chemical study of processes involving the carbonisation of coal by internal heating," by Prof. M. W. Travers. At 2.30 p.m., J. I. Graham and D. G. Skinner will give a paper on "Conversion of coal into oil by the Bergius process," and A. E. Dunstan and H. G. Shatwell will speak on "Liquid fuels, other than petroleum." The Annual Dinner will take place on the 23rd, at the Great Central Hotel, N.W.1.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned. Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £30 per ton; Powder, £32 per ton; Extra fine Powder, £34 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £9 10s.—£10 per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbolie.—Crystals.—7½d. 8d. per lb. Crude 60's, 2s. 3d.—2s. 5d. per gal.
 Acid Cresylic, 99/100. 2s. 11d.—3s. per gal. 97/99. 2s. 4½d.—2s. 8d. per gal. Pale, 95%, 2s. 3d.—2s. 6d. per gal. Dark, 95%, 2s. 1d.—2s. 3d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.
 Toluole.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.
 Creosote.—Cresylic 20/24%, 10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7½d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10d. per gal. Solvent 95/160, 1s. 3d.—1s. 4d. per gal. Solvent 90/190, 9½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.
 Pitch, medium soft.—85s.—87s. 6d. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180.—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 6d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—8d. per lb., naked at works.
 Aniline Salts.—8d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb., 100%.
 Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—5½d. per lb.
 m-Cresol 98/100%.—2s. 7½d. per lb.
 p-Cresol 32/34° C.—2s. 8½d. per lb.
 Dichloraniline.—1s. 10d. per lb.
 Dimethylaniline.—1s. 11d. per lb.
 Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.
 Dinitrochlorobenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—10d. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb.
 β-Naphthylamine.—3s. per lb.
 o-Nitraniline.—5s. 9d. per lb.
 m-Nitraniline.—3s. per lb. d/d.
 p-Nitraniline.—1s. 7d.—1s. 8d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb.
 R. Salt.—2s. 2d. per lb.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—7½d. per lb.
 p-Toluidine.—2s. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—Cryst. 36s.—37s. per cwt. Powder 40s.—41s. per cwt.; Extra Fine Powder, 42s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 7½d.—1s. 10d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 4d.—1s. 6d. per lb. Technical 11½d.—1s. per lb. Good demand.
 Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Amidol.—9s. per lb. d/d.
 Acetanilide.—1s. 11d. per lb. for quantity.
 Amidopyrin.—8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—9s. 6d. per oz.
 Barbitone.—5s. 9d.—6s. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—10s. 4d.—10s. 7d. per lb. Bismuth Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—9s. 10d.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb. Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Subchloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.—8s. 1d.—8s. 4d. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 30 W. Qts.—11½d. per lb.
 Borax B.P.—Crystal 26s. per cwt. Powder 26s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 3d. per lb. Potassium.—

1s. 10½d. per lb. Sodium.—2s. 1d. per lb. Granulated ½d. per lb. less. All spot. Large quantities at lower rates.
 Calcium Lactate B.P.—1s. 4d.—1s. 5d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—4s. 9d.—5s. per lb.
 Hexamine.—2s. 3d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in carboys; Winchester, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchester, 5s. per gal.
 Hydroquinone.—2s. 11d.—3s. 2d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—18s.—22s. per cwt., according to quantity.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol—A.B.R. recryst.. B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb.; Lovig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb.; Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb.; Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.
 Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonal.—8s. 9d.—9s. per lb.
 Metol.—11s. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb.
 Phenacetin.—2s. 6d.—2s. 9d. per lb.
 Phenazone.—4s.—4s. 3d. per lb.
 Phenolphthalein.—6s. 6d.—6s. 9d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2½%.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6d. per lb. spot.
 Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7½d.—1s. 9d. per lb. Crystal, 1s. 8½d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.
 Sulphonal.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Anabepine (*ex Anethole*).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Bois de Rose*) 14s. per lb.—(*ex Shui Oil*) 9s. 9d. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 17s. 6d. per lb.—(*ex Shui Oil*) 13s. 9d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 8d. per lb. Vanillin.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb. Bergamot.—26s. per lb. Bourbon Geranium.—13s. 6d. per lb.
 Camphor.—9d. per lb. Cananga, Java, 15s. 9d. per lb. Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 10d. per lb., c.i.f. U.K. port, for shipment over 1928. Ceylon, Pure, 1s. 8d. per lb. Clove, pure 5s. 3d. per lb.
 Eucalyptus, Australian.—2s. 2d. per lb. Lavender.—Mont Blanc, 28/40%, 17s. per lb. Lemon.—7s. 3d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. per lb. Peppermint.—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—8s. per lb. Sandalwood—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Jan. 9th, 1928. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Nov. 24th. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

1.—Applications

Dunlop Rubber Co., Ltd., Murphy, and Twiss. Concentrating or drying liquids. 20,350. Nov. 3.
 Electroflo Meters Co., Ltd. (Republic Flow Meters Co.). Thermo-couples for pyrometers. 20,518. Nov. 4.

- Garland and Pickard. Edge filtration. 28,970. Oct. 31.
 Geldens. Kilns. 29,273. Nov. 2.
 Johnson (I.-G. Farbenind.). Carrying out photo-chemical gas reactions. 29,259—60. Nov. 2. Treating liquids with gases etc. 29,642. Nov. 5.
 Kingcome. Evaporators. 29,111. Nov. 1.
 Komers. Diffusion apparatus. 29,187. Nov. 1. (Czecho-Slovakia, 19.4.27.)
 Rispler. Extracting solids from fluids. 29,437. Nov. 3.
 Rosenheim, Schuster, and Tintometer, Ltd. Colour-estimating apparatus. 28,981. Oct. 31.
 Seligman. Heat-exchangers etc. 29,357. Nov. 3.
 Soc. Anon. des Charbons Actifs E. Urbain. Separation of mixtures of liquids etc. 29,167. Nov. 1. (Fr., 8.1.27.)
 Zwicky. Filters. 29,565. Nov. 4.

I.—Complete Specifications

- 10,582 (1926) and 566 (1927). Leek, and Wigan Coal & Iron Co., Ltd. Separation of solids and liquids. (279,525.)
 18,732 (1926). Reavell. Separating solids or semi-solids from liquids. (279,544.)
 30,919 (1926). Dorr Co. Separating solids from liquids. (262,479.)
 31,106 (1926). Leek. Heat interchangers. (279,663.)
 15,725 (1927). Allis-Chalmers Manuf. Co., and Newhouse. Crushers. (279,742.)
 728,860 (1927). Laughlin Filter Corp. Centrifugal separators. (279,896.)

II.—Applications

- Bates. Hydrogenating coal. 29,039. Oct. 31. (U.S., 23.11.26.)
 Dowling and Mallagh. Manufacture of incandescence gas mantles. 29,395. Nov. 3.
 Duffield. Gas-producing and oil-recovery plant. 29,165. Nov. 1.
 Goldsbrough. Catalytic agent for generating gas from fuels. 29,390. Nov. 3.
 I.-G. Farbenind. Manufacture of motor fuels. 29,397. Nov. 3. (Ger., 26.11.26.)
 Imperial Chem. Industries, Ltd., and Slade. Production of briquetted fuel. 29,243. Nov. 2.
 Johnson (I.-G. Farbenind.). Treating exhaust gases from combustion motors. 29,640. Nov. 5. Low-temperature carbonisation. 29,641. Nov. 5.
 Lush, and Technical Research Works. 29,526. See III.
 Metallbank und Metallurgische Ges. Production of active carbon. 29,131. Nov. 1.
 Petrole Synthétique Soc. Anon., and Wittonek. Obtaining gaseous hydrocarbons etc. 29,423. Nov. 3. Catalytic treatment of gases etc. 29,674. Nov. 5. (Fr., 18.1.27.)
 Wolters. Regenerative coke-oven plant. 29,536. Nov. 4.

II.—Complete Specifications

- 18,955 (1926). Asiatic Petroleum Co., Ltd., and Egerton. Preventing pinking or knock in internal-combustion engines. (279,560.)
 24,497 (1926). Jubb (Pickering). Treatment of acid sludge or acid resin obtained from the refining of mineral oils. (279,613.)
 27,148 (1926). Alfa-Laval Co., Ltd. (Funk). Treatment of lubricating oils. (279,636.)
 29,762 (1926). Lundin. See VII.
 24,403 (1927). Wigan Coal & Iron Co., Ltd., and Leek. Treating coal etc. material. (279,766.)
 25,328 (1927). Brand and Laing. Utilisation of pulverulent or powdered carbonaceous materials. (279,767.)
 *4618 (1927). Allgem. Ges. f. Chem. Ind. Continuous treatment of hydrocarbons. (279,774.)
 *27,190 (1927). I.-G. Farbenind. Heating carbonaceous materials. (279,825.)
 *27,914 (1927). Chilowsky. Manufacture of gas from heavy oils. (279,834.)

III.—Application

- Lush, and Technical Research Works. Hydrogenation of naphthalene. 29,526. Nov. 4.

IV.—Applications

- *Carpmael (I.-G. Farbenind.). Manufacture of primary hydroaromatic bases. 29,661. Nov. 5.
 Cassella & Co. Anthanthrone dyestuffs. 29,303. Nov. 2. (Switz., 2.11.26.)
 Green. Manufacture of derivatives of acridine. 29,189. Nov. 2.
 Imray (I.-G. Farbenind.). Manufacture of dyestuffs. 29,009—10. Oct. 31.

IV.—Complete Specifications

- 27,013 (1926). I.-G. Farbenind. Manufacture of alkyl-naphthalenes. (260,604.)
 27,224 (1926). Soc. Chem. Ind. in Basle. Manufacture of intermediate products for the dyestuff industry. (260,623.)
 29,841 (1926). I.-G. Farbenind. Manufacture of 1-diazo-anthraquinone-2-carboxylic acids. (262,119.)
 32,107 (1926). Chem. Works (Sandoz). Production of substantive dyestuffs of the stilbene series fast to alkali. (263,192.)
 19,985 (1927). I.-G. Farbenind. Manufacture of triaryl-methane-dyestuffs. (275,609.)

V.—Applications

- Brandwood. Treatment of artificial silk etc. 29,338—9. Nov. 3.
 British Celanese, Ltd., and Ellis. Treatment of materials containing cellulose derivatives. 29,246. Nov. 2.
 British Celanese, Ltd., and Dickie. Manufacture of textile products. 29,247. Nov. 2.
 Courtaulds, Ltd., and Stokes. Production of artificial threads etc. 29,643. Nov. 5.
 Ellis (Soc. Fabr. Soie Rhodiaseta). Treatment of threads etc. containing artificial silk. 29,026. Oct. 31. Treatment of cellulose acetate threads etc. 29,548. Nov. 4.
 Harrison. Manufacture of artificial filaments from viscose. 29,061. Nov. 1.
 Internat. Sugar & Alcohol Co. (Soc. Ind. de la Cellulose). Treatment of cellulose-containing materials with mineral acids. 29,288. Nov. 2.
 Robertson. Treatment of jute etc. fabrics. 29,337. Nov. 3.

V. Complete Specifications

- 10,978 (1926). I.-G. Farbenind. Manufacture of nitro-cellulose solutions and plastics. (251,303.)
 11,652 (1926). Duhamel, and Comp. Gén. des Ind. Textiles. Washing or cleaning wool. (251,609.)
 20,855 (1926). British Dyestuffs Corp., Hollins, and Chapman. Retting of flax and other fibres. (279,583.)
 26,564, 28,444 (1927). I.-G. Farbenind. Manufacture of cellulose acetate solutions and plastics. (278,735 and 279,771.)
 *20,178 (1927). Hölkenside Ges. Treatment of artificial silk. (279,791.)
 *21,007 (1927). I.-G. Farbenind. Manufacture of cellulose esters of inorganic acids. (279,796.)
 *15,544 (1927). Chem. Fabr. vorm. Sandoz. See VI.
 *24,215 (1927). I.-G. Farbenind. Manufacture of amino-cellulose derivatives. (279,801.)
 *28,761 (1927). I.-G. Farbenind. Spinning artificial silk. (279,888.)

VI.—Application

- Carpmael (I.-G. Farbenind.). Dyeing etc. wool and silk. 29,570. Nov. 4.

VI.—Complete Specifications

- 18,730 (1926). Etabl. Petitdidier. Colour printing on fabrics. (256,238.)

*15,544 (1927). Chem. Fabr. vorm. Sandoz. Treating material and artificial cellulose fibres with alkali. (279,784.)
 *28,481 (1927). I.-G. Farbenind. Printing with vat-dye stuffs. (279,864.)

VII.—Applications

Dicker (Philips' Gloeilampenfabr.). Precipitating rhodium, iridium, etc. 29,057. Oct. 31.

Pauling. Production of ammonia-air mixtures. 29,055. Oct. 31.

VII.—Complete Specifications

29,762 (1926). Lundin. Production of carbonic acid gas. (269,478.)

16,141 (1926). Johnson (I.-G. Farbenind.). Manufacture of hydrocyanic acid. (279,530.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*Austria*: Indiarubber articles (393); *Belgium*: Industrial chemicals (394); *British India*: Cement, paper (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1); *Canada*: Metal specialties, asbestos roof tiles, cork coverings, and other building materials (389); *Colombia*: Leather (406); *Egypt*: Steel reservoirs (A.X. 5462); *Germany*: Shellac, gum traganth, gum olibanum, copal, turpentine oil, Japan wax (397); *Greece*: Sugar, tin, tinplate (399); *New Zealand*: Glassware (391); nine centrifugal sewage pumping plants (A.X. 5457); *Norway*: Rubber shoes, leather (102); *South Africa*: Copper wire (A.X. 5468); anti-friction grease (B.X. 3969); *Uruguay*: Twenty-two cranes (A.X. 5478).

Patent Acts and the Irish Free State

An Order in Council, dated November 3, 1927, applies to the Irish Free State the provisions of Section 91 (subsection 5) of the Patents and Designs Acts, 1907 and 1919, relating to the registration of patents, designs, and trade marks. The Order is to be cited as the Patents, Designs, and Trade Marks (Irish Free State) Order, 1927, and takes effect as from October 1, 1927.

News from Advertisements

Applications are invited for the post of senior lecturer in the Department of Pure and Applied Science of Loughborough College (p. vi).

A technical assistant is required for secretarial work by chemical and gas engineer (p. vi).

A junior partnership is required by chemist (p. vi).

A meeting of the Chemical Society Research Fund Committee is announced (p. vi).

Sets of the JOURNAL are offered (p. vi).

There are now 127 firms represented in our Buyers' Guide.

EDITORIAL

Sugar

WE are always pleased when a reader invites us to write an editorial on some particular subject; we cannot, however, always comply with such a request. In the case of sugar we find ourselves in a difficulty because we know very little of the subject and do not even know where to turn for our information. A sugar cane of some sort was native in India and was in early days cultivated in that country, in Persia and China. A variety of the sugar cane seems also to be a native of some of the Polynesian Islands and possibly some of the East Indies, but these have had but little effect on the use of this substance in the Middle Ages in Western Europe. Sugar was known, but we gather not well known, to the ancient Greeks and Romans, and it seems that the Arabs introduced the cultivation of sugar canes into Sicily, Spain and Morocco; the cane was planted in Madeira in 1420 and in San Domingo in 1494, and soon spread in the West Indies and parts of America. The early history of sugar, if preserved at all, is probably to be found in Arabic, Persian, Indian and Chinese writings. We are wholly unacquainted with these; perhaps Mr. Holmyard can help us; he knows some of this literature well. If we have amongst our readers, and we surely must have, some who are acquainted with the Sacred Vedas, we appeal for a reference to the sugar cane said to occur in the Atharva-Veda. Sugar was known in England at the time of the earliest books written in English. It was known here in the thirteenth century, and is mentioned towards the end of the fourteenth century by Langland in *The Vision of Piers Plowman*, by Chaucer in the *Squire's Tale*, and by Usk in the *Testament of Love*. In the *Paston Letters*, in the middle of the fifteenth century, one of the correspondents begs "I pray you that ye woll vouchesaff to send me an other sugor loff." There are plenty of references to sugar in the Elizabethan dramatists. We do not know exactly how they managed without an abundant supply of sugar in the early Middle Ages, but they had less need of it than we have now. They had

no tea or coffee at breakfast and hardly anything worth calling breakfast at all; a glass of beer often sufficed for this meal. In the *Compleat Angler* you may read: — "*Pisc.* What will you have to your breakfast, or what will you drink this morning? *Viat.* For breakfast, I never eat any, and for drink am very indifferent; but if you please to call for a glass of ale, I'm for you; and let it be quickly, if you please, for I long to see the little fishing-house you spoke of, and to be at my lesson. *Pisc.* Well, sir, you see the ale is come without calling; for though I do not know yours, my people know my diet, which is always one glass so soon as I am drest, and no more till dinner: and so my servants have served you." And does not Milton tell us of the guest who "rises, is saluted, and after the malmsey or some well spic'd bruage, and better breakfasted than he whose morning appetite would have gladly fed on green figs," and so on? In very much earlier days when sugar was a rare substance, almost a drug, the pastry cooks probably managed pretty well with honey; they had their sweetmeats made of flowers, as we do to this day, and fancy sweets in the shape of birds and lizards. One of the classical poets speaks of "the dainty cakes that women fashion in the kneading-tray, mingling blossoms manifold with the white wheaten flower, all that is wrought of honey sweet, and in soft olive oil, all cakes fashioned in the semblance of things that fly, and of things that creep." We are sorry we have such meagre information; if our correspondent has access to De Candolle, Marco Polo, and Dioscorides, he might glean something, we do not possess these books and cannot conveniently borrow them. We suppose that in Norman times the inhabitants of this country lived mainly on bread, meat, fish and vegetables; no doubt they had fruits in the summer; honey and salt were plentiful; mead, metheglin, beer, wine and milk sufficed for drinks; sugar was more a curiosity than an item of food. If our readers can tell us why the sugar cane produces so much sugar and most other grasses so little, we shall be glad.

SOME MODERN METHODS OF RECOVERY OF LUBRICATING OIL*

By A. J. BROUGHALL, M.I.Chem.E.

The recovery of used lubricating oil is a matter of considerable importance, not only as a question of economy to the user, but on the general consideration of supply.

During recent years the consumption of oil has very much increased, and attention has been directed to the effect of this increased consumption on the visible supply. The Hoover Committee, U.S.A., stated that the visible supply of lubricating oil in the United States would be consumed in 10 years at the present rate of consumption. The latest figures obtainable for the United Kingdom show that in 1926 91,810,250 gals. of lubricating oils of a value of £1,670,386, was imported. Of this, 2,529,459 gals., to a value of £203,893, was re-exported. During the first nine months of this year the importation has been 72,197,712 gals., valued at £3,715,992. It naturally follows that if the increased consumption affects the supply the prices will tend to rise. Some authorities consider that 70-80% of the total consumption of lubricating oil is recoverable. This figure would appear to be rather high, possibly 50% would be more correct.

The following figures are given by the Diesel Engine Users' Association, taking the average of 44 large stations, for the cost per unit of current generated in Diesel-engined stations in 1924-25:—

Fuel	0.393
Lubricating oil	0.078
Water	0.007
Stores	0.011
Wages for the whole of the running staff	0.148
Repairs, including maintenance, labour and material	0.141
Total	0.778

This shows that 10% of the cost is represented by lubricating oil.

Owing to the possible economy which can be effected by the installation of a suitable plant, it is most desirable that those in charge of machinery and plant using considerable quantities of oil for lubrication should pay particular attention to the possibility of recovery and the re-use of the reclaimed oil for its original purpose, or, if this is not possible, for other uses. Attention was particularly directed to this problem during the war, when it was of the utmost importance to conserve the supply of oil, and, owing to the particular attention directed during this period, advances were made in the design of apparatus suitable for oil recovery.

For many years oil has been recovered in a rough and ready way by means of stand filters, in which the oil was allowed to settle and various filtering media

were used to purify the oil. This method was slow and the efficiency not to be compared with specially designed plant of modern design. Owing to the lack of suitable apparatus, large quantities of oil have been undoubtedly thrown away to waste, and to-day it is quite common to find works and garages with a difficulty of getting rid of accumulated stocks of used oil.

The object of this paper is to set out the result of investigations into this problem by the author during recent years on the plants described. The oils chiefly investigated were cylinder oil, crank-case oil (high-speed engines), dynamo oil, transformer oil, and, to a small extent, oil from the crank-case of internal-combustion engines.

On going into the matter of oil recovery, opposition will possibly be raised by those responsible for using recovered oil, and the question at once arises: Is it possible to purify and recover used oil to make it available for use again, especially for its original purpose? It may be taken that the general considered opinion of those who have made careful investigation is that oil does not necessarily lose its lubricating property by use, and if the impurities present can be removed, there is no reason why a large proportion cannot be made available for its original purpose. In many instances tests have shown that the recovered oil is better than the original; this point is confirmed by the investigation made. In this connexion it is of interest to note that, from reports issued on oil recovery with the Air Service, U.S.A., during the war period, it was found that of the total oil issued 40-50% was returned for reclaiming, and of this amount 70-80% was recovered and used again. An interesting test was also made with a quantity of used lubricating oil, which was purified and returned for use and circulated eight times before any new oil was added. At the end of this period the viscosity was slightly higher than at the start.

The nature of the impurities found in the used oil vary considerably in accordance with the purpose for which the oil has been used, but they may be generally classified as follows:—(1) Water. (2) Metallic particles formed by the abrasion of the working parts. (3) Particles of carbon resulting from the effect of high temperature on the oil. (4) Particles of grit. These impurities are suspended in the lubricant, and as a rule can be easily removed by simple means.

With oil used in the internal combustion engine, other factors enter, such as the dilution of the oil by the heavy ends of the fuel. In some instances the impurities are met with in the form of colloid suspensions which are very difficult to break down.

A number of well-designed plants are now available for oil recovery, and work either on the principle of settling tanks, the centrifuge, or a special type of filter. During the investigation made the following methods were tested:—The settling-tank process, by Industrial Waste Eliminators, Ltd.; the Sharples centrifuge,

* Read at a meeting of the Chemical Engineering Group on Nov. 18, 1927.

made by Super-Centrifugal Engineers, Ltd.; a centrifuge, made by the Alfa-Laval Co., Ltd.; and the stream-line filter, made by the Stream-Line Filter Co., Ltd.

Several other systems are on the market, but these plants are fairly representative of the various methods adopted, and excellent results have been obtained from each of them, the effect of which has been that an organized system has been developed at the works concerned for collecting, purifying and returning the reclaimed oil to the various departments. It may also be stated that considerable economies were effected by reclaiming oil and grease etc. from rags and wipers and afterwards washing them. A brief description of the installations is given below.

SETTLING TANKS (INDUSTRIAL WASTE ELIMINATORS, LTD.)

These (Figs. 1, 2 and 3) are tanks of 80 gal. capacity fitted with steam-heated coils and a draw-off arrangement for the reclaimed oil, water and impurities. A

Fig. 1
Oil settling and purifying tank

special ball valve is provided which is adjusted to close the outlet for clean oil in order to prevent water and impure oil passing through. The general method of operation is to put the dirty oil in the tank in quantity sufficient just to cover the top coil.

Some test should be made in order to find out the nature of the impurities present and the general state of the oil. With heavy oil containing fine particles of grit and carbon in suspension, it has been found an advantage to add a solution of brine; and if acidity is present to any extent it is usual to add soda ash. The oil is heated to boiling point and kept at this temperature for 15 to 20 min. The heat is then regulated to keep the temperature at approximately 170–180° F. and the oil allowed to settle for two weeks. When

reclaiming lighter oils the period of settling is one week and the temperature is regulated to 150° F.

To draw off the recovered oil the pure oil pipe is regulated by a float just to skim the surface of the oil, which is run out into the receiving vessel through fine flannel.

A special design of turbine centrifugal extractor (Fig. 2) is made by the same firm for the recovery of oil from

Fig. 2
Cross-section of steam turbine centrifugal oil extractor.
Industrial Waste Eliminators, Ltd.

rags and sponge cloths. The steam used for driving is allowed to pass through the machine and the materials impregnated with the oil are heated and oil and water are released by centrifugal force.

SHARPLES SUPER-CENTRIFUGE (SUPER-CENTRIFUGAL ENGINEERS, LTD.)

The Sharples Super-Centrifuge (Figs. 4 and 5) is designed to run at very high speeds, 15,000 to 17,000

Fig. 3
Cross-section of steam turbine centrifugal oil filler. Industrial
Waste Eliminators, Ltd.

r.p.m., and is of rather an unusual type. It is claimed that the centrifugal force developed is equal to approximately 17,000 times that of gravity. It consists of a special form of casing in which is housed the cylinder or bowl, which is in the form of an elongated hollow cylinder 30 in. long, 4½ in. in diameter. This bowl is of light construction, made from high tensile steel machined all

over to ensure accurate balance, and is suspended by a flexible joint from a driving spindle fitted with special ball bearings, and at the foot it is fitted with a special spigot rotating within a guide bushing which limits the lateral movement. The method of construction is such that the bowl is easily removed for cleaning.

The dirty oil is fed in at the bottom of the bowl, and under the action of centrifugal force three layers of material are formed, the pure oil in the centre or

At the upper end of the bowl special discs are fitted with provision for the outlet of the pure oil and water. These are of an interchangeable type, and can be varied according to the class of oil treated. This centrifuge is designed to be driven by electric motor, belt, steam, or compressed air.

The oil to be treated should be heated to a temperature of 150° F. to facilitate separation. When dealing with oil containing considerable amounts of impurities or

FIG. 4

Sharples centrifuge. Cross-section of machine

inner layer, water in the intermediate layer, and the solid matter in the outer layer. The liquid under treatment is maintained at the same speed of rotation as the bowl by a one-piece three-wing attached to the upper portion of the bowl. A good feature of this design is that the liquid flow is at right angles to the direction of centrifugal force, and the distance traversed between the inlet and outlet is approximately 25 times the thickness of the liquid layer.

presenting unusual features, special methods of treatment are adopted, and it is usual to provide receiving tanks in which the oil can be treated preparatory to centrifuging. A solution of sodium hydroxide is recommended to neutralise acidity and as a means of flocculating the fine particles of carbon.

A noteworthy feature of this machine, considering its high speed, is its remarkable freedom from vibration. It is also very accessible, the various adjustments and

cleaning operations being accomplished quite easily. When considerable impurity is present in the material their striking uniform and many of the delegates being in academic dress. The meeting was held in the presence

FIG. 5

Sharples centrifuge. Typical installation

to be treated, it is usual to supply a spare bowl for use while the other bowl is being cleaned.

A special form of casing for these machines is fitted where it is necessary to conform to the Board of Trade requirements on board ship, and provides for the total enclosure of the upper portion of the machine to prevent the escape of fumes.

(To be continued)

THE CENTENARY OF MARCELLIN BERTHELOT

By A DELEGATE

About 1800 "delegates," representing all nations, attended the meeting. The first event was a brilliant "crush" at the Sorbonne on Sunday evening, October 23, where we met many old friends. On the Monday, after inspecting various Berthelot relics at the Faculté de Pharmacie (Berthelot began his career in 1859 as Professor of Organic Chemistry at the École Supérieure de Pharmacie), a large body of chemists assembled in the courtyard of the Collège de France, where he became Professor of Organic Chemistry in 1865. Prof. Schlenk, President of the German Chemical Society, and Prof. Bogert here spoke on behalf of the delegates. The laboratories in which Berthelot worked, now occupied by M. Moureu, were inspected with great interest by many. Afterwards a tablet attached to his early residence, 113, Rue St. Martin, was unveiled. In the afternoon a crowded reception was held at the Hôtel de Ville. After several speeches, one of them by Prof. Nasini on behalf of the delegates, came music and dancing by experts from the Opera. In the evening a brilliant company assembled in the Great Amphitheatre of the Sorbonne, the members of the Academy wearing

of the President of the Republic, M. Painlevé, President of the Berthelot Committee, taking the chair. Music was provided by the celebrated band of the Garde Républicaine. Proceedings were opened by M. Moureu delivering an éloge upon Berthelot. After the overture of Ramuntcho had been most beautifully played by the band, laudatory speeches were made by M. Lecomte, Director of the French Academy; by M. Lacroix, Perpetual Secretary of the Academy of Sciences; by M. Gley, President of the Academy of Medicine; by M. Wéry, President of the Academy of Agriculture; finally, after another musical interval, by M. Hodza, Minister of Public Instruction of Czechoslovakia. Then we were regaled with over half an hour of comic opera, during which congratulatory addresses were presented by all and sundry in best "stage attire." Finally, M. Painlevé addressed the meeting.

The Hall of the Sorbonne is a magnificent amphitheatre seating about 4000 people, without a trace of echo. The President of the Academy of Medicine made it clear that it was possible for a practised speaker, gifted with a sonorous voice, to be generally heard; other speakers were but partially audible. Strangely enough, on this, as on almost every other occasion, the speeches were read, so that the oratorical charm which usually characterises French speaking was lacking.

The first ceremony on Tuesday was a very impressive commemorative meeting at the Pantheon, where Berthelot and his wife are buried. Delegates were then conveyed by motor car to Versailles and the huge party was entertained at lunch in the celebrated long gallery. The lunch was served with remarkable perfection and in the greatest comfort. Two speeches were delivered, Prof. Pictet representing the delegates. The

party then inspected the treasures of the Palace. At night there was a gala performance at the Opera—the first act of Massenet's *Hérodiade* and two ballets.

On Wednesday the first act was the laying of the foundation stone of the *Maison de la Chimie* by M. Herriot, Minister of Public Instruction. At twelve, delegates left by motor car for Chantilly, the country house of the Institute of France. Here the lunch was a scramble but visitors found satisfaction in the autumnal beauty of the grounds and the art treasures in the mansion. In the evening the President of the Republic received delegates at the Palace of the Elysée. The very perfect entertainment provided included not only music and dancing but also a philosophic dialogue by Paul Claudel, in homage to the memory of Berthelot, in which his ideas were reproduced. Even our Cambridge representative was overcome by the highbrow character of the discourse.

The final event of interest was a luncheon given by the President of the Chemical Society of France, M. Urbain and French colleagues at their club. At least seventy chemists were present, including the aged Prof. Konovalow; also Profs. Willstätter, Haber, Schlenk, Stock and Bodenstein. That we survived the ordeal of so many gatherings is remarkable, but the French always charm ever so wisely that it is impossible to resist their allurements. All will thank them for the gift of a *Souvenir du Centenaire*, containing a brief notice of Berthelot's life history and many portraits of himself and his co-workers.

The meeting has been full of lessons. Nominally, the celebration of the centenary of Berthelot, the chemist, in reality it has been far more. It was obviously calculated also to serve propagandist ends, in particular to bless the inauguration of a *Maison internationale de la Chimie*, the intention being to make this a meeting place for chemists of all nations, in Paris, whilst using it mainly for purposes of international documentation of chemical literature. The bizarre programme provided was the expression of the attempt to meet these two ends. Delegates were presented with a ponderous tome of 373 pages, containing lists of committees "pour l'édification de la *Maison de la Chimie*," established all over the world, including Panama—a striking proof of the energy displayed in organising the enterprise. Nearly 16 million francs have been subscribed, about half in France.

At the Commemoration in the Great Hall of the Sorbonne the addresses delivered by M. Moureu and his colleagues of the Institute of France were all in perfect taste and in keeping with the object of honouring Berthelot's memory. A false note was struck, however, by the delivery of a long address by the Czechoslovakian Minister of Public Instruction. Still less happy was the presentation of a multitude of official congratulatory addresses from here, there and everywhere, beginning with Abyssinia and Afghanistan and ending with Tchecoslovaquie. Such padded and potted appreciation is worthless. The mistake was in issuing invitations to all and sundry. Very wisely, at the various meetings, the speaking was confined to a few, usually one Frenchman and one foreign delegate. The delegates chosen, in not a few cases, in no way represented science—the

choice made may have been good as *réclame* but was not dignified. A strong opinion prevailed that not only French chemists but chemists generally were put into a false position. We may hope that the outworn practice of presenting formal addresses from learned and other bodies on such occasions received its death blow at the meeting; it cannot well be continued much longer with dignity. Some simpler and more direct means of offering congratulations must be devised.

The feeling among representative chemists present at the meeting was clear. All were anxious to have the work of Berthelot fully recognised and his memory honoured; few, however, seemed to favour an over-ambitious international scheme. Each of the chief countries prefers to do its own work of documentation; indeed several already have highly organised machinery for the purpose. The hope prevailed that the scheme will

LES VEINARDS.

(Après le centenaire de Villemain et celui de Berthelot, élu de Fresnel.)

— Vous en avez de la veine, vous autres, les savants... Qu'est-ce qu'on vous fait comme belles fêtes... après votre mort !...

Lucky Beggars.—After the centenaries of Villemain, Fresnel and Berthelot

Lucky chaps, you scientific men. Look what fine entertainments they provide for you . . . after you're dead ! . . .

be revised, so as to meet the wants of French chemists in particular. We, in England, know full well how great is our need of a meeting house, where all our interests may be worthily centralised. A similar home for French chemistry would doubtless be of great value in France. If a laboratory of the Davy-Faraday-Dewar Royal Institution type could be associated with it, so much the better.

The fact is, scientific workers are becoming rather tired of these international organisations. The meetings they entail are very pleasant up to a point but whilst the value of social intercourse cannot be over-rated, attendance at them is a very costly and time-wasting business. In most cases such gatherings have no broad scientific outcome. The meetings are too frequent and it is impossible to secure the attendance of representative delegates. Scientific joy-riding at public cost is fast being developed into a fine art, almost a profession by

the few. Chemists have had warning by the failure hitherto of the International Union of Pure and Applied Chemistry to do work of a character which in any way serves to justify its great cost, both to subscribing bodies and to individuals attending the meetings.

Unless the Union can be organised upon a basis very different from that which has prevailed, it must shortly come to an end. Chemists view with grave mistrust and apprehension the obvious attempt that is being made to "bureaucratise" the interests of chemistry, fearing another Geneva and another Albert Thomas. Subscriptions to the building will not alone be demanded. The maintenance of an international enterprise such as that contemplated will be very costly. Governments will be asked to contribute and work in the several countries will suffer by the diminution of their home grants. Let us hope that our French colleagues will recognise that true charity begins at home. We shall all profit if they set the example.

COMPANY NEWS

VICKERS LTD., AND SIR W. G. ARMSTRONG WHITWORTH AND CO.

A provisional agreement has been signed between Vickers Ltd., and Sir W. G. Armstrong Whitworth & Co. for the amalgamation of certain of their important works and businesses now engaged principally in naval shipbuilding, and in the manufacture of heavy and special steel and armaments. The agreement provides for the formation of a new company called Vickers-Armstrongs, with an initial capital not exceeding £21,000,000, to take over the amalgamated businesses from January 1, 1928, and the whole matter will be submitted at an early date for the approval of the debenture holders and shareholders concerned in both companies. The first directors will be General Sir Herbert A. Lawrence (chairman), General Sir Noel Birch, Sir George Buckham, Commander C. W. Craven, Sir A. Trevor Dawson, Sir Mark W. Jenkinson, Mr. G. R. T. Taylor, Sir George Hadcock, Sir Otto Niemeyer, Mr. E. R. Peacock, and Mr. J. Frater Taylor.

DORMAN LONG AND CO., LTD.

A dividend has been declared on the 6% cumulative preference shares for the half-year ended September 30, 1927.

PAN DE AZUCAR NITRATE CO., LTD.

The net profit for the year ended June 30, 1927, was £10,326, plus £17,267 brought in compared with a net profit of £22,011 for the previous year. A final dividend has been recommended of 10% less tax, making 15% carrying forward £14,393. No nitrate was manufactured at the company's oficina during the period under review, the profit shown being derived from the sale of nitrate stocks brought forward from the previous year. Extensive alterations and additions to the plant and machinery are being carried out with a view to reducing the cost of production, which will delay the reopening of the oficina.

ZINC CORPORATION, LTD.

A dividend has been declared of 2s. per share on the preference shares, being the last half of the fixed preferential dividend for 1927, and also an interim participating dividend of 1s. 6d. per share on both preference and ordinary shares, less tax.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

COAL CLEANING CONFERENCE

A reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, is now ready.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

EDINBURGH SECTION

The second joint meeting for the present session of the Edinburgh and East of Scotland Sections of the Institute of Chemistry and the Society of Chemical Industry was held in the hall of the Pharmaceutical Society on November 17, Major Bruce presiding.

A paper entitled "Chemical formulae of long ago" was read by Prof. R. M. Caven, of Glasgow. The lecturer traced the gradual development of the use of chemical symbols and formulae from the time when picture writing and Egyptian hieroglyphics were first used to designate substances used in chemical operations. In the middle ages, when alchemy was at its height, the earlier and simpler symbols were augmented by allegorical representations of reactions which gave less accurate conceptions of the truth, and tended to throw a veil of mystery over comparatively simple experiments. A great step was made in 1792 by the introduction of Bergmann's symbols. Unfortunately, this chemist had some difficulty in reconciling his symbols with the phlogiston theory, which detracted from their clarity. They gave, however, a wonderfully accurate picture of a reaction, even suggesting ionisation in solution—at that time not yet discovered. During the great age of chemical discovery, symbols were abandoned by all the great chemists except Lavoisier, owing to their complexity. His symbols, as modified by Hassenfratz and Adet, represented a great advance on any system yet invented. They were even capable of indicating what physical state the reacting materials were in, and they were comparatively simple. The last exponent of the symbol method of notation was Dalton. After him, however, his method gave place to the modern system introduced by Berzelius, in which letters take the place of symbols.

The meeting concluded with a hearty vote of thanks to the lecturer, proposed by Mr. J. Adam Watson, chairman of the Local Section of the Institute of Chemistry. Messrs. Rutherford, Hill, and Kermack also voiced the appreciation of the meeting.

NOTTINGHAM SECTION

The second meeting of the session was held jointly with the Midlands Section of the Society of Dyers and Colourists on November 9, at University College, Nottingham, Mr. Harcastle in the chair. Two papers were given:—(1) "The action of chlorine and hypochlorous acid on wool"; (2) "The action of formaldehyde on wool," by S. R. Trotman, M.A., and E. R. Trotman, Ph.D.

Dr. Trotman said that in previous investigations they had shown that the action of hypochlorous acid on wool is quite different from that of chlorine. Further experiments had shown that chloramines are produced when chlorine acts on wool, but none are produced by the action of hypochlorous acid. This led the authors to look for groups which might react with hypochlorous acid. Carbonyl groups are, of course, present in large quantities in the keratin molecule, and a possibility would be some kind of reaction between these and the hypochlorous acid. Direct combination would give $\text{--NH}\cdot\text{C}(\text{OH})(\text{OCl})$. This compound, however, would tend to become unstable, and might either (i) give back the carbonyl group and hypochlorous acid, or (ii) decompose thus: $\text{--NH}\cdot\text{C}(\text{OH})(\text{OCl}) \rightarrow \text{N}:\text{COCl} + \text{H}_2\text{O}$. The experiments seem to show that the latter reaction is more probable, since there is strong evidence that some portion, though not all, of the ketone groups is modified by hypochlorous acid. It is possible, however, that

$$\text{OH}$$

the group $\text{>C} \begin{smallmatrix} \text{OH} \\ \diagup \\ \text{OCl} \end{smallmatrix}$ is stable in the wool protein

molecule. Dr. Trotman described experiments on the effect of condensation with semicarbazide, and showed that the results indicated that hypochlorous acid reacts with the carbonyl groups of the wool protein whilst chlorine does not.

The presence of hydrochloric acid has a profound influence in modifying the course of the reaction between chlorine and the wool substance. The divergence between the two reactions lies in the observations that both in the absence and presence of sulphuric acid the action of chlorine on the wool substance is to cause a scission of the amino nitrogen, whilst in the presence of hydrochloric acid the reaction seems to consist almost entirely of dissolution of the wool substance as a whole. The scission of amino nitrogen takes place to only a very limited extent, viz., 0.03%. This action at once explains the cause of the lower nitrogen values obtained for wool chlorinated in presence of hydrochloric acid and then with semicarbazide. With hypochlorous acid, a slight dissolution of the wool substance as a whole probably takes place.

Dr. Trotman next gave a short account of the action of formaldehyde on wool. The moisture content of air dried paraformaldehyde wool was found to be considerably lower than that of untreated wool. No change occurs in the nitrogen content during treatment with formaldehyde or paraformaldehyde.

The resistance of formaldehyde wool to the action of alkalis appears to be superior to that of paraformaldehyde wool. Formaldehyde wool has a somewhat lower shrinkage than the untreated wool when subjected to normal washing, but when milled, no difference in either shrinkage or felting can be detected. Untreated fabrics and fabrics treated with formaldehyde showed no difference in the percentage of damaged fibres or in weight lost during chlorination. In the action of dyestuffs, formaldehyde has practically no affinity for neutral dyeing and dyestuffs. When dyed in presence of acetic acid, the affinity for the dyestuff develops slowly, with sulphuric acid the affinity develops quickly, and the formaldehyde-treated wool becomes as deeply dyed

as the untreated wool. It is evident that the affinity for acid dyestuffs is due to hydrolysis of the formaldehyde compound. The protection against bacterial action is very marked. Dr. Trotman also gave a theoretical explanation of the results.

YORKSHIRE SECTION

The "Chemists' Dinner" will be held on December 2, at the Great Northern Hotel, Leeds. This year it will be regarded as a local celebration of the Jubilee of the Institute of Chemistry, but it is open to all chemists in the area to participate. The President of the Society (Mr. F. H. Carr, C.B.E.) will be in the chair. Tickets (6s. 6d. each) may be obtained from Mr. H. J. Hodsman, The University, Leeds.

CALENDAR OF FORTHCOMING EVENTS

Nov. 25.—Society of Chemical Industry and Institute of Chemistry, *Edinburgh and East of Scotland Sections*. Social evening. Party at the Palais de Danse, Edinburgh, at 8 p.m.

Nov. 30.—Royal Society of Arts, John Street, Adelphi, W.C.2, at 8 p.m. "Marcellin Berthelot and synthetic chemistry," by Prof. H. E. Armstrong. His Excellency the French Ambassador will preside.

Dec. 1.—Society of Chemical Industry, *Bristol Section*. Joint meeting with the Fuel Section. The University, Woodland Road, Bristol, at 7.30 p.m. "Low-temperature carbonisation," by Dr. C. H. Lander.

Dec. 1.—Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. *Ordinary Scientific Meeting*. "Action of Beckmann's chromic acid mixture on some monocyclic terpenes," by T. A. Henry and H. Paget; "The condensation of glyoxalines with formaldehyde," by R. Grindley and F. L. Pyman; "Glyoxalins-4(5)-formaldehyde," by W. Hubball and F. L. Pyman; "Studies of dynamic isomerism. Part XXVI. Consecutive changes in the mutarotation of galactose," by G. F. Smith and T. M. Lowry; "Triazole compounds. Part II. Methylation of some 1-hydroxy-1:2:3-benzotriazoles," by O. L. Brady and C. V. Reynolds; "The reaction between diaryloxy-isopropyl alcohols and phosphorus oxychloride in the presence of pyridine," by D. R. Boyd and D. E. Ladham.

Dec. 2.—Institute of Chemistry, *Leeds Area Section*. "Chemists' Dinner" at the Great Northern Hotel, Leeds. Tickets (6s. 6d. each) may be obtained from Mr. H. J. Hodsman, The University, Leeds.

Dec. 2.—Society of Chemical Industry, *Manchester Section*. Joint meeting with the Fuel Section, Engineers' Club, 17, Albert Square, Manchester. "Coal and co-partnership," by J. A. Bowie.

Dec. 5.—Biochemical Society, Imperial College of Science and Technology, South Kensington, S.W.7.

Dec. 5.—Society of Chemical Industry, *London Section*. Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "Automatic analysis of liquids and its application to control of water-softening plants," by Dr. H. S. Hatfield.

Dec. 6.—Society of Chemical Industry and Institute of Chemistry, *Edinburgh and East of Scotland Sections*. The Pharmaceutical Hall, 36, York Place, Edinburgh, at 7.30 p.m. "Electro-synthesis," by Prof. Sir James Walker.

Dec. 7.—Society of Chemical Industry, *Nottingham Section*. "The indole group of the alkaloids," by Prof. R. Robinson.

CHEMICAL SOCIETY

At a meeting on November 17 the President, Prof. H. Brereton Baker, C.B.E., F.R.S., reminded Fellows that applications for research grants must be received by December 1, and that the meeting arranged for December 15 had been abandoned in view of the Jubilee Dinner of the Institute of Chemistry being held on that evening.

Mr. B. Cavanagh read the following papers:—

Differential Potentiometric Titration. Parts I and II.

I.—THE end-point of a titration is determined from two or three measurements of the potential, corresponding with one or two large additions of reagent. In its simple form the method depends on the assumption that the added reagent reacts completely, which implies that the end-point is not reached, and this sets a limit to the absolute precision attainable, which can be improved to a limited extent by the method of Part II.

If m c.c. of reagent added to V_0 c.c. of solution alter the potential by ϵ m.v., then the further amount (M c.c.) required to reach the end-point is given by $M = m \cdot f(\epsilon_m)$, where $\epsilon_m = \epsilon - \epsilon_v + \epsilon_\gamma$. The "corrections" ϵ_v and ϵ_γ for change of volume and activity coefficient respectively are defined by $V_0/m = f(\epsilon_v)$; $\gamma_0/(\gamma - \gamma_0) = f(\epsilon_\gamma)$, the function being of the form $f(\epsilon) = \frac{1}{2} [\coth (E/2RT) \epsilon - 1]$. ϵ_γ and the temperature correction are negligible, but ϵ_v is often very large.

II.—Based on thermodynamic relations only, the exact equation $(Mn \sqrt{\gamma\gamma' \theta \theta'})/2s(V_0 - M) = \sinh [F(E - E_0)/RT + \frac{1}{2} \log \gamma\gamma'/\gamma\gamma' + \frac{1}{2} \log \theta\theta'/\theta\theta']$ (where θ, θ' are the adsorption factors, E the measured potential, suffix e the end-point values, n the normality of the reagent, and s the activity product of the precipitate) for titrations typified by the silver-chloride titration, has been obtained. An equation is derived from which, by means of a family of curves, the value of M can be determined from a single potential change. This extends the method of Part I to the end-point region, and the conditions for maximum precision are seen from the curves. Another equation immediately permits the exact determination of the result of the titration from two successive potential changes, and yields probably the most precise possible method of analysis.

Dr. J. F. Spencer said that the method appeared to be no more rapid than the usual one, and involved the use of curves which must be prepared by the experimenter himself. In the example quoted the accuracy attained was far below that obtained by the ordinary method.

Dr. J. J. Fox remarked that for dilute solutions the only satisfactory methods had hitherto been weight-volumetric and nephelometric processes.

Mr. Cavanagh maintained that the accuracy is greater than that usually obtained, and that precision is dependent on concentration, and pointed out that the complex mathematics does not actually enter into the calculations. In reply to Dr. S. Sugden, he said that variations in solubility with fineness of division of the silver chloride do not, in practice, introduce error.

The President said that the method would be useful in certain atomic weight determinations.

Dr. F. M. Hamer described:

A General Method for the Preparation of Carbocyanine Dyes.

THE various types of carbocyanines and the methods hitherto used in preparing them are summarised. The method consisting in condensation of ethyl orthoformate with quaternary salts containing reactive methyl groups is converted by the introduction of pyridine as solvent into an excellent practical and general process for preparing carbocyanine dyes. The preparation of three 2:2'-carbocyanines by the pyridine method is described, the yields varying from 70—79% as against 21% by the best method hitherto known; the method is also applied to dicyanines, to three 4:4'-carbocyanines, to three thiocarbocyanines, to two so-called oxacarbocyanines, and to two so-called indocarbocyanines. Certain new dyes are described. Where this has not previously been done, the photographic properties of the dyes are recorded; it is found that the oxacarbocyanines and indocarbocyanines, like other cyanine dyes, are photographic sensitisers.

Mr. B. V. Storr expressed the hope that studies of the sensitisation of silver bromide would eventually lead to an understanding of the effect of light on silver bromide itself.

Mr. O. F. Bloch remarked that by supplying the dye in a form suitable for absorption by the silver halide, the range of compounds available as sensitisers had been increased. The colour of the dye-silver halide complex differs from that when other carriers are used, and bleaching is more rapid. The author's work opened up important problems relating to adsorption.

Prof. C. S. Gibson discussed:—

A Comparison of Analogous Organic Compounds of Phosphorus and Arsenic. [With J. D. A. Johnson.]

THE phosphinic acid grouping in phenylmethylphosphinic acid (I) behaves like a carboxyl grouping since the acid readily forms an acid chloride, esters and an anilide.

The arsinic acid grouping in the corresponding arsinic acid (II) behaves differently. When thionyl chloride reacts under the usual conditions with compound (II) phenyldichloroarsine and probably methyl chloride are formed, since under the same conditions from compound (III) phenyldichloroarsine and chlorobenzene are obtained. The ethyl ester of compound (I) was not obtained when its silver salt was treated with ethyl iodide.

The mechanism of the action of thionyl chloride on secondary arsinic acids is discussed.

Prof. G. T. Morgan directed attention to differences in the purely inorganic behaviour of phosphorus and arsenic, where the "working force" must be the same as in the reactions described.

Mr. M. A. Phillips remarked on the distinction between the silver salts of primary and secondary arsinic acids in regard to the formation of alkyl esters. The arsinous acids readily form esters by this method.

Dr. E. E. Turner said that the authors' observations exhibited analogy to the fact that arsenic, but not phosphoric, acid is a strong oxidising agent. In the reduction of an arsinic acid by hydrochloric and sulphurous acids, an oxychloride appears to be formed. Some arsinic acids, particularly benzyl-derivatives, are decomposed even by cold hydrochloric acid, and phenylbenzylarsinic acid even gives benzyl chloride when warmed with phenyldichloroarsine.

Dr. J. D. A. Johnson said that the amphoteric nature of the secondary arsinic acids makes it difficult to say whether in phenarsazinic acid hydrochloride the hydrogen chloride is associated with the nitrogen or with the arsenic atom. Dissolution of phenylarsinic acid in concentrated hydrochloric acid is more probably due to the formation of an oxychloride than to that of a simple hydrochloride.

Dr. J. L. Simonsen described

Derivatives of Methyl 2:2-dimethylcyclopentan-3-one-1-carboxylate. [With C. S. Gibson and K. V. Hariharan.]

The authors describe an improved method for the preparation of 2:2-dimethylcyclopentan-3-one-1-carboxylic acid. On bromination the methyl ester yields methyl 2:2-dimethyl-4,4-dibromocyclopentan-3-one-1-carboxylate. This ester on treatment with barium hydroxide yields 2:2-dimethyl-4-hydroxy- Δ^5 -cyclopentan-3-one-1-carboxylic acid.

CORRESPONDENCE

REMUNERATION OF THE CHEMIST

SIR, Some weeks ago there appeared in this JOURNAL a copy of an unusual letter, setting out in detail the terms of engagement of a chemist for a particular post. To the majority of your readers it would be a surprise to learn that a qualified chemist should be expected to put in 12 hours a day for 7 days a week and to receive remuneration at the rate of 1s. 2d. per hour.

This letter was succeeded by another asking for a disclosure of the name of the firm in question, but the present writer thinks it should be made known that such terms are not imaginary and are not limited to an individual company; they appear to be the general rule for an industry in this country; moreover, one that is much talked of and heavily subsidised by the Government: I refer to the beet sugar industry.

The various factories have an intensive campaign during the winter and engage chemists temporarily, and the writer knows in the case of at least half a dozen (and, personally, has had the offer of such a post by two of them) that the chemical staff is engaged on the terms quoted, namely, 12 hours a day, 7 days a week (this includes an 18 hour shift at the "turn over") for about four months, at the attractive salary of £20 per month.

This seems to be a standard rate, and no additional recompense was offered to a chemist with ten years' factory experience as compared with one newly graduated. This new industry has published in the press this week its profits for last season's working, and it is anything but encouraging to the profession to think that the scientific control of the chemical processes (which has its due proportion of the making of these profits) should be obtained so cheaply.

The unfortunate fact is that the companies know that at the commencement of the campaign there is a sufficient number of trained chemists unemployed who are so near to the point of desperation as to accept positions on the terms mentioned: these at the end of so many months are once more out of place, most probably much the worse for the long duties and absence of a resting day, but have the satisfaction of having managed to keep alive during the winter by pocketing the huge sum of £80 to £100. The following season a fresh staff is advertised for—and so the industry succeeds and makes its profits.

An appeal has been made that a larger proportion of the Government grant should go to the farmers, but surely the chemical staffs, as another unit of the trade, have also a just claim to a fair share of it in the form of reasonable terms of service.

I am, Sir, etc.

"CHEMIST"

PERSONAL AND OTHER ITEMS

Sir Max and Lady Muspratt have sailed from England in the *Cheshire*, on a visit to Ceylon.

At the last associate membership examination of the Institution of Chemical Engineers, held in June and July of this year, the following candidates satisfied the examiners: Harold Hunter, Edward Wallis, and Edward William Wigg.

The late Prof. H. R. Procter, for 22 years head of the Leather Industries Department of the Yorkshire College and the University of Leeds, left £17,502. All his scientific and technical books and instruments are left to the Procter Research Laboratory in Leeds University.

An International Chemical Review

A special chemical number will be issued with the ordinary number of "The Times Trade and Engineering Supplement" of November 26. It will contain a number of important articles dealing with the chemical production of the world, and can be obtained for the inclusive price of 3d.

Nitre Deposit in N. Australia.

According to Sir Douglas Mawson, a large deposit of potassium nitrate has been found 120 miles east of Alice Springs, in Northern Australia.

Institution of Chemical Engineers

An important series of meetings will be held on December 7, 8 and 9 at the Chemical Society's Rooms, Burlington House, W.1.

On December 7 there will be one session only, at 5 p.m., when the President, Sir Alexander Gibb, will take the Chair, and Mr. Norman Swindin will read a paper on "Submerged flame combustion."

The two sessions on December 8 will be devoted to a discussion on refrigeration, under the chairmanship of Mr. J. Arthur Reavell, Vice-President. Three papers will be read at 5 p.m., as follows:—(a) "The design of refrigerating plants," by Mr. G. W. Daniels; (b) "The practical aspect of refrigeration as applied to the chemical industry," by Mr. Leung Chew; and (c) "Electrical automatic refrigerators for domestic use," by Mr. Raymond Mitchell. After an adjournment for dinner at 6.45 p.m., the discussion on these papers will open at 8 p.m.

On December 9, at 5 p.m., with Mr. W. A. S. Calder, Vice-President, in the chair, Mr. W. J. Jones will read a paper entitled "The problem of industrial lighting with some reference to the chemical industry." At 8 p.m. on the same evening, Mr. William Macnab presiding, two papers will be read:—(a) "Continuous weighing of the contents of vessels: the weighmeter," by Messrs. R. G. Parker, D. N. Jackman and J. N. Vowler, and (b) "The properties of silica and fireclay refractories in relation to their industrial usage," by Mr. A. T. Green.

The President and Council of the Institution will be pleased to welcome all who may be interested in any of the above subjects. Application for admission to any particular session should be made to the Hon. Secretary of the Institution on or before December 2. Advance proofs of the papers will shortly be available, and may be obtained on application to the Hon. Secretary, The Institution of Chemical Engineers, Abbey House, Westminster, London, S.W.1.

Smoke Abatement

The Minister of Health proposes to make an Order extending the list of noxious and offensive gases, and also the list of works mentioned in the Act. A public enquiry into the proposed Order will be held on December 14 at the Ministry of Health, Whitehall. A full notice will be found on p. vi.

Research on Mine Rescue Apparatus

The Secretary for Mines has appointed the following to be a Committee to report to the Safety in Mines Research Board from time to time what research is required for the improvement of mine rescue apparatus and equipment, and how such work should be carried out, and as a Committee of the Board, to co-ordinate research on this subject that the Board may undertake to carry out by its own investigators:—Mr. Robert Clive (chairman), Mr. James R. L. Allott, Mr. G. L. Brown, Dr. J. S. Haldane, F.R.S., Mr. W. E. T. Hartley, Mr. P. S. Hay, Prof. J. A. S. Ritson, Mr. J. H. Thorne, Dr. R. V. Wheeler, and a representative of the Chemical Warfare Research Department.

Low Temperature Carbonisation

A circular has been issued by the Low Temperature Carbonisation Co., Ltd., setting forth the present position of its process. The process of low temperature carbonisation produces from each ton of coal distilled the following:—14 cwt. of smokeless fuel called "Coalite," 20-22 gallons of oil and 6000 cb. ft. of gas having a thermal value of about 700 B.Th.U. The company's works are at Barugh, near Barnsley, where there are five batteries of retorts, the first of which was started up in July. The process is working night and day, seven days a week. The normal weekly output of the main products is 1020 tons of "Coalite" smokeless fuel, 28,320 gals. of oil, and 7,000,000 cb. ft. of gas.

German Chemical Fusion

The Chemische Fabrik auf Aktien (vorm. E. Schering) and the Kahlbaum concern have amalgamated to form a single company, the Schering-Kahlbaum A.-G.

Coal Research in Czechoslovakia

An institute for research on coal has been formed in Prague with the help of the State and all the coal producers in Czechoslovakia.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial.—Cryst., £30 per ton; Powder, £32 per ton; Extra fine Powder, £34 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60d. per ton, 168° Tw., Arsenical, £5 10s. per ton, 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P. Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate.—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
Arsenic Sulphide, Yellow.—1s. 9d. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 9d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep.—6s.—6s. 3d. per lb.

Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £10 5s. per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.

Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.

Red Liquor.—9d.—10d.

Wood Creosote.—1s. 9d. per gal., unrefined.

Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.

Wood Tar.—£4—£5 per ton.

Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—7½d.—8d. per lb. Crude 60's, 2s. 4d.—2s. 5d. per gal.

Acid Cresylic, 99/100.—2s. 11d.—3s. per gal. 97/99.—2s. 4d.—2s. 5½d. per gal. Pale, 95%, 2s. 3d.—2s. 4d. per gal. Dark, 95%, 2s. 1d.—2s. 2d. per gal.

Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.

Benzole.—Crude 65's, 9½d.—9¾d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 6d. per gal., ex works in tank wagons.

Toluole.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—2s. per gal.

Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.

Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7¾d. per gal. ex works. Salty, 7d. per gal., less 1½%.

Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10d. per gal. Solvent 95/160, 1s. 3d.—1s. 4d. per gal. Solvent 90/190, 9½d.—1s. 3d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.

Naphthalene.—Crystals. £11 10s.—£13 10s. per ton. Flaked, £12 10s.—£13 per ton.

Pitch, medium soft.—85s.—87s. 6d. per ton, f.o.b. according to district. Market firm.

Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180—4s. 6d.—5s. per gal. Heavy.—4s.—4s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 6d. per lb.

Acid Amidonaphthol disulpho (1.8.2.4.) 10s. 9d. per lb.

Acid H.—3s. per lb.

Acid Naphthionic.—1s. 6d. per

Acid Neville and Winther.—4s. 9d. per lb.

Acid Sulphanilic.—8½d. per lb.

Aniline Oil.—8d. per lb., naked at works.

Anthranilic Acid.—8d. per lb., naked at works.

Benzaldehyde.—1s. 2d.—1s. 4d. per lb., 100%.

—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—5½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—1s. 10d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.

Dinitrochlorobenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

α-Naphthol.—2s. per lb. d/d.

β-Naphthol.—10d. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

o-Nitraniline.—5s. 9d. per lb.

m-Nitraniline.—3s. per lb. d/d.

p-Nitraniline.—1s. 7d.—1s. 8d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—7½d. per lb.

p-Toluidine.—2s. per lb., ex works, naked.

m-Xyldine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 4d.—2s. 5d. per lb.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Soley ex Gum.—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—Cryst. 36s.—37s. per cwt. Powder 40s.—41s. per cwt.; Extra Fine Powder, 42s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 7d.—1s. 8d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 4d.—1s. 6d. per lb. Technical 11½d.—1s. per lb. Good demand.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Acetanilide.—1s. 6d.—1s. 9d. per lb. for quantity.

Amidol.—7s. 6d.—9s. per lb. d/d.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton, Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—10s. 4d.—10s. 7d. per lb. Bismuth

Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—

9s. 10d.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—

8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb.

Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Sub-

chloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.—

8s. 1d.—8s. 4d. per lb. Extra and reduced prices for

smaller and larger quantities respectively; Liquor

Bismuthi et Ammon. Cit. B.P. in W. Qts.—1s. 1d. per lb.;

12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 25s. per cwt. Powder 26s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 3d. per lb. Potassium.—

Anthranilic
Benzaldehyde

1s. 10½d. per lb. Sodium.—2s. 1d. per lb. Granulated ½d. per lb. less. All spot. Large quantities at lower rates.
 Calcium Lactate B.P.—1s. 4d.—1s. 5d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—4s. 9d.—5s. per lb.
 Hexamine.—2s. 3d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal. in carboys; Winchesters, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchesters, 5s. per gal.
 Hydroquinone.—3s. 3d.—3s. 6d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate—B.P.—2s. 2d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—18s.—20s. per cwt., according to quantity.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots Red oxide, 7s. 6d.—7s. 7d. per lb.; Lévig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.
 Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonal.—8s. 9d.—9s. per lb.
 Metol.—9s. 11s. 6d. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb. less in quantity
 Phenacetin.—2s. 6d.—2s. 9d. per lb.
 Phenazone.—4s.—4s. 3d. per lb.
 Phenolphthalein.—6s. 6d.—6s. 9d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 98s. per cwt., less 2½%.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferrieyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6½d. per lb. spot.
 Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb. carr. paid.
 Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7d.—1s. 8d. per lb. Crystal, 1s. 8d.—1s. 9d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.
 Sulphonal.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Aubepine (ex Anethole).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(ex Bois de Rose) 14s. per lb.—(ex Shui Oil) 9s. 9d. per lb. Linalyl Acetate.—(ex Bois de Rose) 17s. 6d. per lb.—(ex Shui Oil) 13s. 9d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 8d. per lb. Vanillin.—10s. 6d. per lb.

ESSENTIAL OILS

Almond. Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb. Bergamot.—26s. per lb. Bourbon Geranium.—13s. 6d. per lb.
 Camphor.—9d. per lb. Cananga, Java, 15s. 9d. per lb. Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 10d. per lb., c.i.f. U.K. port, for shipment over 1928. Ceylon, Pure, 1s. 8d. per lb. Clove, pure 5s. 3d. per lb.
 Eucalyptus, Australian—2s. 2d. per lb. Lavender.—Mont Blanc, 28/40%, 17s. per lb. Lemon.—7s. 3d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. per lb. Peppermint—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Potitgrain.—8s. per lb. Sundalwood—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST.

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Jan. 16th, 1928. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Dec. 1st, 1927. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

British Dyestuffs Corp., Ltd., Saunders, and Williams. Thermal decomposition of substances. 29,757. Nov. 7.
 Buss. Apparatus, for making extracts and infusions. 30,064. Nov. 9.

Calico Printers' Association, Ltd., and Watson. Drying-cylinders. 30,302. Nov. 11.

Carborundum Co., Ltd. Furnaces. 30,086. Nov. 9. (U.S. 27,12,26.)

Carborundum Co., Ltd. (Carborundum Co.). Kilns. 30,448. Nov. 12.

Chem. Engineering & Wilton's Patent Furnace Co., Wilton, and Wilton. Apparatus for treating gases with liquids. 29,926. Nov. 8.

Comp. des Mines de Bruay. Furnace. 29,778. Nov. 7. (Fr. 27.7.27.)

Crénond. Filters. 29,950. Nov. 8.

Electroflo Meters Co., Ltd. Recording pyrometers. 29,861. Nov. 8.

Empson. Centrifugal separators. 29,888. Nov. 8.

Excelsior Feuerlöschgeräte A.-G. and Treichel. Extinguishing fires. 29,809. Nov. 7. (Ger. 15.11.26.)

Fells and Firth. Manufacture of adsorbents. 29,895. Nov. 8.

Fusion Corp., Ltd., and Hollins. Extraction of dust or solid particles from gases. 30,363. Nov. 11.

Harding. Filtering-apparatus. 30,115. Nov. 10.

Hump. Crushing etc. mills. 30,183. Nov. 10.

Laughlin Filter Corp. Centrifugal separators. 29,967. Nov. 8. (U.S. 20,1.27.)

Loewe. Obtaining high vacuum. 30,103. Nov. 10. (Ger. 11.11.26.)

Scott. Prevention of caking of crystals etc. 30,374. Nov. 11.

Snow. Emulsifiers, mixers, etc. 30,238. Nov. 10.

Steele, Steele, and Sutton. Dry separation. 30,191. Nov. 10.

Studienges. f. Gas-Ind. Producing compressed gases. 30,201. Nov. 10. (Ger. 10.11.26.) Conveying and consuming liquid air. 30,202. Nov. 10. (Ger. 10.11.26.) Accumulating, conveying, etc. liquefied gases. 30,155. Nov. 12. (Ger. 13.11.26.)

Wilderman. Filter presses. 30,143. Nov. 10.

Zeiss. Colorimeters. 30,020. Nov. 9. (Hungary. 10.11.26.)

I.—Complete Specifications

19,040 (1926). Andrews. Classification of powdered materials by elutriation. (279,932.)

19,199 (1926). Ges. f. Lande's Eismaschinen. Transmission of heat from one gas to another. (256,271.)

19,322 (1926). Carpmacel (I.-G. Farbenind.). Extracting and drying inorganic jellies. (279,941.)

24,987 (1926). I.-G. Farbenind. Treating liquids containing tasty and aromatic substances. (259,598.)

30,654 (1926). Woodall Duckham (1920), Ltd., and Duckham. Tunnel kilns. (280,044.)

32,640 (1926). Robinson and Parkes. Resolution of emulsions or suspensions containing tar or oil. (280,059.)

18,077 (1927). Siemens & Halske A.-G. Pyrometers. (274,096.)

*21,039 (1927). Filtration Engineers, Inc. Filter-cake treating-devices. (280,170.)

*29,182 (1927). Sandor. Producing foam. (280,208.)

II.—Applications

Bowater and Lynn. Intermittent carbonising plants. 29,825. Nov. 7.

Drake, and Drakes, Ltd. Producer etc. furnaces. 29,995. Nov. 9.

Flawn. Fuel for cooking, heating, etc. 29,686. Nov. 7.

Johnson (I.-G. Farbenind.). Recovery of oxidation products of solid hydrocarbons. 29,711. Nov. 7.

Lander and Shaw. Low-temperature carbonisation of bituminous coals etc. 30,365. Nov. 11. Vertical retorts etc. 30,366. Nov. 11.

Martin and Thame. Extraction of oil from shale etc. 30,193. Nov. 10.

Montgomerie. 30,283. See IX.

Moore and Moore. Apparatus for manufacture of combustible gas. 30,104. Nov. 10.

Ramsay. Distillation of carbonaceous material. 30,275. Nov. 11.

Regenerative Coal Gasification System, and Travers. Apparatus for enriching gas. 30,353. Nov. 11.

Sharples Specialty Co. Refining petroleum. 30,087. Nov. 9. (U.S. 9.11.26.)

Smith. 29,913. See VII.

Smith. Apparatus for extracting tar from gases etc. 30,324. Nov. 11.

II.—Complete Specifications

19,578 (1926). Elhs (Foundation Oven Corp.). Coke ovens. (279,955.)

28,922 (1926). Collins. Apparatus for refining or cracking of hydrocarbons. (280,039.)

32,640 (1926). Robinson and Parkes. See I.

32,714 (1926). Ammonia. Purifying gas. (263,830.)

28,540 (1926). Collins. Refining or cracking of hydrocarbons. (280,034.)

6298 (1927). Kohlenveredlung A. G. Working of gas retorts. (267,153.)

6299 (1927). Dicker (Nederlandsche Bims-Cement- en Asphaltd.). See IX.

12,404 (1927). I.-G. Farbenind. Extraction of carbon dioxide from gaseous mixtures. (271,852.)

*18,724 (1927). Koppers Co. Purification of fuel and other gases. (280,165.)

III.—Complete Specification

32,640 (1926). Robinson and Parkes. See I.

IV.—Applications

Cassella & Co. Manufacture of anthranthrene dyestuffs. 30,241. Nov. 10.

Comp. Nat. de Mat. Colorantes. Manufacture of halogenated organic compounds. 30,354. Nov. 11. (Fr. 23.7.27.)

Crood (Pyridium Corp.). Preparing water-soluble azo dyes. 30,170. Nov. 10.

Hellriegel and Traube. Producing N-monoalkyl derivatives of the aminophenols. 30,025. Nov. 9. (Ger. 15.11.26.)

Imperial Chemical Industries, Ltd. and Alchem. Dyes. 29,756. Nov. 7.

Selden Co. 30,327. See XX.

IV.—Complete Specification

*29,303 (1927). Cassella & Co. Manufacture of dyestuffs of the anthranthrene series. (280,217.)

V. Applications

British Celanese, Ltd., Ellis, and Olpin. Treatment of cellulose derivatives. 29,738. Nov. 7.

Brown, Godsaver, and Hall. Manufacture of cellulose products. 30,457. Nov. 12.

Courtaulds, Ltd., Huxley, and Morton. Production of artificial threads etc. 29,727. Nov. 7.

Dreaper. Manufacture of artificial silk etc. 30,287. Nov. 11.

Gough. Drying raw wool. 30,069. Nov. 9.

Happer. Manufacture of paper. 30,411. Nov. 12.

Imperial Chemical Industries, Ltd., Jenkins, Payman, and Swann. Cellulose ester solutions. 29,938. Nov. 8.

Imperial Chemical Industries, Ltd., and Jenkins. Nitro-cellulose products. 30,206. Nov. 10.

Nederlandsche Kunstzijdefabr. Preparing artificial silk. 30,296 and 30,314. Nov. 11. (Holland, 27.12.26 and 25.2.27.)

Toda. Treating viscose filaments. 29,724. Nov. 7.

V.—Complete Specifications

- 13,730 (1926). I.-G. Farbenind. Treating articles with soaps. (253,105.)
 19,403 (1926). Lapierre. Treatment of hemp etc. (279,946.)
 5618 (1927). Jackson (Bennett, Inc.). Production of waterproof paper or paperboard. (280,083.)
 8784 (1927). Clavel. Treatment of artificial silks. (280,094.)
 28,580 (1927). British Celanese, Ltd. Products from organic derivatives of cellulose. (280,195.)

VI. Applications

- Brandwood. Dyeing artificial silk threads etc. 30,002. Nov. 9.
 Crompton. Dyeing cloth. 30,442. Nov. 12.
 Haddan (Soc. des Textiles Roannais). Hydrophilising textile fibres. 30,188. Nov. 10.
 Hunt, and Hunt & Moscrop, Ltd. Bleaching kiers. 29,982. Nov. 9.
 Silver Springs Bleaching & Dyeing Co., and Hall. Production and colouring of textile yarns etc. 29,872. Nov. 8.

VI.—Complete Specifications

- 19,325 (1926). British Dyestuffs Corp., Horsfall, and Lawrie. Colouring furs and other materials. (279,942.)
 19,482 (1926). Etabl. Petrididier. Colour printing on fabrics. (258,562.)
 23,161 (1926). British Dyestuffs Corp., Baddley, and Chapman. Manufacture of wetting-out agents etc. (279,990.)

VII. Applications

- Deutsche Gold- & Silber-Scheideanstalt. Oxygen-evolving preparations for respiratory apparatus etc. 30,040. Nov. 9. (Ger., 10.11.26.)
 Johnson (I.-G. Farbenind.). Production of anhydrous metallic chlorides. 29,739. Nov. 7.
 Kisscock. Production of molybdates. 29,790. Nov. 7. (U.S., 6.11.26.)
 Messer, and Messer & Co. Ges. Separation of air into oxygen and nitrogen. 29,815 and 30,339. Nov. 7 and 11. (Ger., 15.11.26.)
 National Processes, Ltd., and Robson. Roasting pyrites etc. 29,881. Nov. 8.
 Scott. 30,371. *See* I.
 Smith. Recovery of ammonia from coal gas etc. 29,913. Nov. 8. Manufacture of lead carbonate. 30,060. Nov. 9.
 Stuhenges f. Gas Ind. 30,202. *See* I.

VII.—Complete Specifications

- 19,322 (1926). Carpmuel (I. G. Farbenind.) Extracting and drying inorganic jellies. (279,941.)
 *29,790 (1927). Kisscock. Producing molybdates. (280,240.)

VIII. Application

- Setterberg. Manufacture of porous refractory bricks etc. 29,855. Nov. 8. (Sweden, 26.11.26.)

IX.—Applications

- Baxter. Hydraulic cement etc. 30,207. Nov. 10.
 Carpenter. Manufacture of cement. 30,107. Nov. 10.
 Grote, and Musag Ges. 30,036. *See* X.
 Lindman. Manufacture of porous clinker-like materials. 30,190. Nov. 10. (Sweden, 10.11.26.)
 Montgomerie. Bituminous emulsions. 30,283. Nov. 11.

IX.—Complete Specifications

- 6299 (1927). Dicker (Nederlandsche Buis-Cement- en Asphaltind.). Preparing an artificial asphalt material. (280,085.)

X.—Applications

- Anthoine. Treatment of low-grade ores. 29,777. Nov. 7.
 British Thomson-Houston Co., Ltd. Alloys. 29,731. Nov. 7. (U.S., 9.11.26.)

Carpmuel (I.-G. Farbenind.). Decomposition of chromium ore etc. 30,242. Nov. 10.

Cheeseman and Cheeseman. Solder for aluminium etc. 29,072. Nov. 9.

Coles. Preparation of iron surfaces for painting. 30,274. Nov. 11.

Goodyear Tire & Rubber Co. Preventing dissolution of metals in pickling-baths. 30,232. Nov. 10. (U.S., 21.10.27.)

Grote, and Musag Ges. Transformation of slag into slag sand. 30,036. Nov. 9. (Ger., 20.11.26.)

Gustafsson. Producing metals from their sulphides. 29,751. Nov. 7. (Sweden, 11.11.26.)

Hadfield. Heat treatment of steel. 29,916. Nov. 8.

Johnson (I.-G. Farbenind.). Recovery of metals etc. soluble in ammoniacal liquors. 29,743. Nov. 7.

Smith. Treatment of metalliferous materials. 30,059. Nov. 9.

Sundberg. Manufacture of iron etc. articles. 29,963. Nov. 8.

Zohrab. Reduction of iron ores. 29,920. Nov. 8.

X.—Complete Specifications

- 19,057 (1926). Jessup. Electrolytic production of metals. (256,610.)
 3468 (1927). Joseph and Schnorr. Silver alloys. (280,073.)
 10,208 (1927). Rutsche. Removing deposits, scale, or incrustations from metal. (280,099.)
 11,490 (1927). Tainton. Electrodeposition of zinc. (280,103.)
 14,725 (1927). Cholewinski. Bearing-metals. (272,889.)
 15,154 (1927). Aluminium-Ind. A.-G. Electrolytic extraction of pure aluminium from crude aluminium alloys etc. (272,246.)

XI. Applications

- Almeida Accumulators, Ltd., and Levy. Electric cells. 30,205. Nov. 10.
 Everett. Storage batteries. 30,371. Nov. 11. (U.S., 3.9.27.)
 Marchini (Passatti). Production of insulating-material. 29,871. Nov. 8.
 Oldham & Son, Ltd., and Wilde. Galvanic batteries etc. 30,194. Nov. 10.

XI.—Complete Specifications

- 17,179 (1926). Edison Swan Electro Co., Ltd., and Webster. Preparation of electric accumulator plates. (279,926.)
 19,057 (1926). Jessup. *See* X.

XII.—Complete Specifications

- 13,099 (1927). I.-G. Farbenind. Soap preparations. (280,110.)
 *28,471 (1927). Vidal. Production of fatty bodies soluble in water. (280,193.)

XIII.—Applications

- British Dyestuffs Corp., Ltd., Stafford, and Walker. Manufacture of phenolic resins. 30,225. Nov. 10.
 Canadian Electro Products Co. Manufacture of synthetic gum or resin. 29,843. Nov. 8. (U.S., 8.11.26.)
 I.-G. Farbenind. 29,764. *See* XX.

Imperial Chemical Industries, Ltd., Hill, and Walker. Manufacture of artificial resins. 30,349. Nov. 11.

Pollopas, Ltd., Baly, and Baly. Manufacture of aldehyde condensation products. 30,259-60. Nov. 11.

XIII.—Complete Specifications

*20,509 (1926). British Dyestuffs Corp., Hollins, and Chapman. Manufacture of inks. (279,968.)

30,314 (1926). Torrance, and Torrance & Sons, Ltd. Plant for manufacture of paints, enamels, inks, etc. (280,041.)

32,857 (1926). Quittner. Manufacture of elastic and waterproof coatings. (263,849.)

10,210 (1927). Chem. Fabr. vorm. Schering. Printers' ink. (270,671.)

*29,843 (1927). Canadian Electro Products Co., Ltd. Manufacture of synthetic gum or resin. (280,246.)

XIV.—Application

L.-G. Farbenind. Preservation and treatment of latex. 30,433. Nov. 12. (Ger., 11.11.26.)

XIV.—Complete Specifications

25,561 (1926). Tomlinsons (Rochdale), Ltd., and Smith. Drying rubber. (280,016.)

25,968 (1926). Soc. Italiana Pirelli. Protection of rubber articles against ageing. (260,001.)

509 (1927). Roessler & Hasslacher Chemical Co. Vulcanisation of rubber. (265,169.)

XV.—Applications

Arnot. Hydrolysis of casein etc. 30,452. Nov. 12.

Jalowez and Stiasny. Tanning hides etc. 29,795. Nov. 7.

XVI.—Complete Specifications

*29,392 (1927). Bauer and Szold. Production of manure from molasses waste. (280,219.)

*29,543 (1927). Soc. Anon. Union Agricole de Jodoigne. Complete dissolved manure. (280,226.)

XVII.—Application

Anc. Etabl. Navy, Jeanjean, et Cie., Baker, Perkins, Ltd., and Hulme. Crystallisation of gums etc. 29,786. Nov. 7.

XVII.—Complete Specifications

*30,159 (1926). Raffinerie Tirmontoise. Refining massecuite etc. (280,152.)

*29,392 (1927). Bauer and Szold. See XVI.

*29,764 (1927). L.-G. Farbenind. See XX.

XVIII.—Application

Johnson (L.-G. Farbenind.). Cultivation of micro-organisms etc. 29,742. Nov. 7.

XIX.—Applications

Arnot. 30,452. See XV.

Büning. Increasing percentage of fat in milk. 29,753. Nov. 7.

Donner. Preservation of liquid eggs etc. 30,138. Nov. 10.

Serafian. Concentrating fruit juices etc. 29,854. Nov. 8.

XIX.—Complete Specifications

19,743 (1926). Marks (Industrial Appliance Co.). Curing flour. (279,958.)

22,476 (1926). Fujii. Preparation of flavouring, nourishing, and similar substances. (279,985.)

24,987 (1926). L.-G. Farbenind. See I.

*20,280 (1927). Grönningaer, and Fischer-Hollinshead Co., Inc. Transferring vitamins. (280,212.)

XX.—Applications

Chem. Works Sandoz. Manufacture of chemotherapeutical compositions. 29,927. Nov. 8. (Switz., 15.1.27.)

Preparation of bile acid salts of cinchona alkaloids. 29,928. Nov. 8. (Switz., 17.12.26.)

Firth and Towson. Chlorinating organic materials. 30,258. Nov. 11.

L.-G. Farbenind. Manufacture of condensation products from urea. 29,764. Nov. 7. (Ger., 6.11.26.)

Manufacture of hydrogenated naphthostyryls. 30,058. Nov. 9. (Ger., 25.11.26.)

Johnson (L.-G. Farbenind.). 29,741. See II. Production of thiourea. 30,046. Nov. 9.

Laboratorium Tasch. Recovery of organic substances from liquors. 30,167. Nov. 10. (Ger., 28.2.27.)

Merck, Merck, Merck, Merck, and Merck. Manufacture of arylaminoalkyl carbinols. 30,229. Nov. 10. (Ger., 10.11.26.)

Pollopas, Ltd., and others. 30,259-60. See XIII.

Selden Co. Catalytic oxidation of organic compounds. 30,327. Nov. 11. (U.S., 3.6.27.)

XX.—Complete Specifications

13,813 (1926). Dreyfus. Manufacture of aliphatic acid anhydrides. (279,916.)

*19,868 (1927). Calcott, Parmelee, and Lorrman. Producing tetra-ethyl lead. (280,169.)

*28,220 (1927). Holzverkohlungs-Ind. A.-G. Production of acetone. (280,184.)

*29,764 (1927). L.-G. Farbenind. Manufacture of condensation products from urea and an alcohol or a ketone. (280,238.)

XXI.—Applications

Howard and Robertson. Obtaining photographic prints 30,171. Nov. 10.

Johnson (L.-G. Farbenind.). Preparation of photographic emulsions. 29,744. Nov. 7.

Martinez. Colour-responsive photographic surfaces. 29,720. Nov. 7.

XXI.—Complete Specification

13,274 (1927). L.-G. Farbenind. Photographic emulsions. (271,475.)

XXII.—Applications

Imperial Chemical Industries, Ltd., and Jenkins. 30,206. See V.

Schaub. Production of nitrocellulose. 30,437. Nov. 12.

Scott. Explosives. 30,375. Nov. 11.

XXIII.—Applications

Dallyn. Purifying sewage etc. 30,302. Nov. 11.

Deutsche Gold- und Silber-Scheideanstalt. 30,040. See VII.

Dickinson and Groombridge. Manufacture of insecticides. 30,215. Nov. 10.

Sim. Deaerating feed water for boilers. 30,105. Nov. 12.

No. 48

EDITORIAL

Research

IMPERIAL CHEMICAL INDUSTRIES, LTD., have appointed a research council which will be presided over by Sir Alfred Mond, and will include Dr. G. C. Clayton, M.P., Col. G. P. Pollitt, Mr. J. Rogers, Major F. A. Froeth, F.R.S., Dr. E. F. Armstrong, F.R.S., Dr. R. E. Slade, Mr. H. A. Humphrey, Sir Frederick Keeble, F.R.S., and the following academic representatives: Professors F. G. Donnan, F.R.S., R. Robinson, F.R.S., W. A. Bone, F.R.S., F. A. Lindemann, F.R.S., and Dr. E. K. Rideal. Major A. E. Hodgkin will act as secretary. We are quite sure that a council containing so many men of vision and experience will organise the research they are concerned in so as to produce the greatest result from the funds at their disposal. The problem of research in general, when looked at from the point of view of the chemist, is not a simple one. There is a great mass of research being conducted at the present time by students, industrial companies, universities and the Government, and it is perhaps worth spending a few minutes in considering these separately. Most of the research conducted by students is valuable as a training for them, but is not of great value to anyone else, even if it contribute a few new facts to the immense mass already known. Without having real knowledge of the problem, it has appeared to us, in recent years, that there are more highly-trained chemists now available than good posts for them: the supply is greater than the demand: we could more easily find competent chemists at two or three pounds a week than mechanics skilled in some special trade, at five pounds a week. Why more of the younger generation do not think of this important fact, we are unable to state. If a few thousand men and women were to train as skilled professional pianists every year, the majority of them would be glad to receive three pounds a week, and they would not receive a much higher salary, even if the standard of training were raised. We think the supply of trained chemists exceeds the demand, and the amount of research conducted by chemical students is in excess of what is economically justified. So far as research by industrial companies is concerned, including so vast and important

an organisation as Imperial Chemical Industries, we think each individual company or firm must decide for itself how much money should be spent on research and on what sorts of research: the same is true of research organisations designed for particular trades: the conditions vary so much that each case must be considered on its own merits. Subject to what we have already stated about students, we have the highest opinion of the research carried on by the universities. Lastly, we come to the research conducted by the Government: so far as chemistry and associated sciences and industries are concerned, we think the Government is unduly lavish with its money, having regard to the state of our finances, industry and taxation. We admit, however, that we have no really reliable data to go upon: we have this opinion quite strongly, but it may possibly be an instance that when the judgment is weak, the prejudice is strong.

Retirement of Prof. E. C. Williams

Prof. E. C. Williams, who has been Professor of Chemical Engineering at University College, has been remarkably successful, almost too great a success. He has proved to University College that chemical engineering can and should be properly taught there and that the benefits which the present students receive from their training should be extended and enlarged by the provision of more building and equipment. He has proved to the oil industry that his abilities will be useful to them, and we understand that he will soon be engaged in organising research in oil problems in California. It is a pity that he cannot stay to put the department in the order which University College desires, but we ought to be thankful that his zeal and efficiency have inspired the college authorities to the considerable development they have in mind. It is rumoured that a strong committee has been formed to raise funds and to organise a chemical engineering department, not only worthy of that branch of engineering, and of University College, but also worthy to be a testimony to the skill and enthusiasm shown by Prof. Williams. It is stated that Sir Alfred Mond will be the chairman of the committee.

and that it will include Sir R. Waley Cohen, Sir David Milne Watson, and Sir Frank Heath. Prof. Williams is particularly good as a teacher, an investigator and an administrator; his academic career has been distinguished. He would have been certain to attain to greater heights as a teacher had he not impressed the industrial world with the belief that he possessed good sense as well as marked ability. This error may be a fatal obstacle to his academic progress. The committee appointed to deal with the situation is a strong one; whether strong enough to find a successor equal to Prof. Williams we do not know. We wish him good fortune in California; we feel sure that he carries with him the respect of his colleagues and his students; he leaves behind him a little constructive work for the committee to do; the members whose names we have given all like work, and take every opportunity of filling up their spare time; if they are fairly representative of the committee useful work will speedily be done.

The Times Chemical Supplement

The International Chemical and Allied Industries number of *The Times Trade and Engineering Supplement* is a handsome journal of 36 pages, and it gives a more complete account of the chemical industry of the world than any other publication we remember. It is worth buying and worth keeping, and those portions we have read are worth reading. The chemical industry has now become a very large and important one, and it will in the course of time not only grow in size and importance, but will permeate more and more into other industries. Prof. E. C. Williams writes the first article in this number, one on "The chemical engineer," and he considers, among other matters, the necessity for vision and foresight and the possibility of these qualities being possessed by financiers and chemists. In his view "there can be no far-seeing to one who is not raised above the level, and to see far in chemical industry it is upon a structure of chemistry and engineering that he must be raised." The chemist alone is, according to Prof. Williams, probably more near-sighted than the financier alone. We wonder if chemists will admit this statement; probably not. Even if it is true, the explanation is possibly that the profession of chemistry is so overcrowded that the pay of the majority is inadequate and they must work so long hours to make an income that they have neither time nor energy left for other pursuits. There are many other articles worth reading: one on "Cyanides," by Kenneth M. Chance; on "Explosives," by W. Macnab; on "British fine chemicals," by C. A. Hill; on "Non-ferrous ores," by W. G. Wagner; on "Modern steel," by Sir Robert Hadfield; on "The metallurgy of zinc," by H. M. Ridge; and on "Chemical societies and institutions," by R. B. Pilcher, and others by many well-known men. The illustrations and tables of statistics are abundant, and we think that if the chemists and the managers and directors of the chemical industry would find the time to read this publication it would be a good thing. No one could make a habit of reading supplements of so broad a nature and remain near-sighted. The first page of the number is alone worth more than the 3d. which is the price of the whole 36 pages.

SOME MODERN METHODS OF RECOVERY OF LUBRICATING OIL

By A. J. BROUGHALL, M.I.Chem.E.

(Concluded)

CENTRIFUGE (ALFA-LAVAL CO., LTD.)

This centrifuge (Figs. 6, 7, 8 and 9) is of a neat compact design similar to this firm's well-known cream separator, and consists of a casing in which is housed the mechanism for driving the cylindrical bowl. This bowl, which has a conical top, is of a special floating construction and self balanced. It revolves at 6000 to 9000 r.p.m., according to size, and the special feature is the fitting of a number of conical discs, each of which have a certain number of holes.

The bowl is designed to act either as a purifier or a clarifier. When used to purify oil which contains water and solid impurities, a special fitting is supplied for the upper portion of the bowl, and by fitting various sized discs adjustments can be made for the difference in specific gravity. The fitting has outlets for the pure oil and for water, the solid impurities being retained in the bowl.

Before putting oil into the machine, water is fed in to form a seal. The oil to be purified is fed in the central cavity at the top of the bowl and passes down a tube to the bottom, where it is subjected to the action of centrifugal force, which causes the heavier particles to travel at right angles to the axis of rotation.

The dirty oil on reaching the bottom of the bowl is

FIG. 6.—Alfa-Laval centrifuge. Section through bowl

distributed between the discs in thin films through a series of holes. Whilst in this finely divided state purification is effected; the solid particles strike the underside of the conical disc, move outwards and are deposited on

the bowl and the liquid is discharged through a special outlet.

This firm supplies special washing and settling tanks for treating the oil previous to it going through the centrifuge. Trisodium phosphate is recommended to neutralise

FIG. 7.—Alfa-Laval centrifuge. Cross-section of machine.

the periphery of the bowl. The water passes outwards on the underside of the discs and forms the intermediate layer, passing out through the water discharge pipe at the top, the pure oil passing along the upper side

FIG. 8.—Alfa-Laval centrifuge. Installation.

acidity, and, in certain cases, a solution of sodium silicate. Water is added to the oil and the mixture is heated to a temperature of 190° F. before passing it through the centrifuge.

A good feature of this machine is accessibility, the bowl being easily removed for cleaning purposes.

FIG. 9.—Alfa-Laval centrifuge. Installation, with tanks.

of the discs towards the centre, and being discharged through the pure oil pipe.

When using the machine for clarifying, another fitting is supplied by means of which the solids are retained in

For dealing with the oil from the crank case of internal-combustion engines, where it is generally found that the viscosity of the oil has been lowered owing to dilution by the heavy ends of the fuel, a special plant is provided

by means of which the diluent can be removed and the oil restored to its original viscosity.

STREAM-LINE FILTER (STREAM-LINE FILTER CO., LTD.)

This is a special type of filter which has given very good results on oil recovery. It was described by Prof. H. S. Halc-Shaw in June, 1923, before the London Section of the Society. The basic feature is that when a liquid containing solid particles is brought against the edges of a pile of suitably prepared impervious papers, the solids are arrested at the edge and only the clear liquid goes *between*, not through the leaves. This provides a filtering medium, the degree of fineness of which can be regulated as desired, as with increasing pressure on the pile of papers constituting the filter, particles of diminishing size can be filtered out until, at a pressure of 40–50 lb. per sq. in. on the column of papers, even the fine colloidal carbon held in suspension in used lubricating oil can be completely removed.

Two experiments will be made to illustrate this point. In the first, a sample of used lubricating oil will be passed through an ordinary high-grade gravimetric

FIG. 10

Stream-line filter. Section through machine

filter paper, when it will be seen that the oil passing through is still discoloured and contains colloidal carbon in suspension. A similar sample of oil will be passed through the filter, and an examination of it will show that the whole of the colloidal carbon has been filtered out.

The second experiment, which demonstrates the extreme fineness of filtration, shows the complete removal of one of the finest artificially-prepared precipitates that can be obtained, namely, a cold precipitated barium sulphate, which passes freely through the gravimetric filter paper, but is completely arrested by the stream-line filter having a pressure of 20 lb. per sq. in. on the filter pack and 2 to 3 lb. on the liquid. It is of interest to notice the relative rates of filtration through these two media. In view of the fact that the particles of solid which have to be removed from a used oil are in a general way much smaller than the thickness of the paper, it is of particular importance that these shall be prevented from entering between the fibres, which would cause the thickening of the edges. The characteristics

which have made this filter so valuable commercially for the recovery of used oil depend upon the impervious nature of the paper, which has made it possible to devise the extremely simple cleaning operation.

In its commercial form (Figs. 10 and 11) the stream-line filter consists of a series of columns A of specially-prepared paper which are fitted between a grid end plate B and a top plate C in a cast-iron or mild steel casing,

FIG. 11

Stream-line filter. Unit before closing

the columns being held together under pressure by springs G carrying the grid. The used oil is caused to flow between the sheets by a difference of pressure between the two sides of the columns, produced either by a pressure pump or a small vacuum pump. The solid residue remains on the outside of the columns, and only the clean oil goes *between*, but not through the papers, into the centre holes which communicate with the outlet.

It will be noted, on referring to the tables giving analyses of used oils, that they contain not only carbon and asphaltenes, but usually water from the products of combustion of the fuel, and petroleum products, either from the fuel itself or from the breakdown of this fuel as

fractions of fuel oil and the water are evaporated and discharged with the air from the exhaust of the vacuum pump. The division of the supply of oil into extremely thin layers, in its passage between the papers, brings it into an ideal condition for the complete removal of these products.

Tests made with this apparatus on used oils show that clean oil is obtained equal to its original quality, and that water and solid particles are completely removed.

FIG. 12

Stream-line filter. Self-contained electrically-heated plant

in the Diesel engine. It is essential that these as well as the carbon should be removed if the oil is to be restored to its original condition.

To do this the plant (Fig. 12) has been arranged to operate by means of vacuum and at a temperature of

FIG. 13

Stream-line filter. Showing—(a) collection of solid residue on surface; (b) completeness of removal by compressed air

The illustration of an incandescence lamp (Fig. 14) immersed in the recovered oil is of interest in showing the purity of the recovered oil. In view of the principle upon which this filter works the question of keeping the filtering surfaces clean is of importance. This cleaning is effected by simple reversal with compressed air (Fig. 13), and experiment shows the completeness and simplicity of this operation. In the commercial plant the small vacuum pump is used for this purpose, as by the moving of a lever from the position marked "Filter"

FIG. 14

Stream-line filter. Incandescence lamp immersed in—(a) recovered oil; (b) used oil

150–170° F. The small vacuum pump driven by a motor of from $\frac{1}{8}$ to $\frac{1}{2}$ h.p., according to the size of the plant, gives a vacuum of from 28½ to 29 in. of mercury, and under this pressure and at 150–170° F. the light

to "Drain," the oil then in the filter is allowed to drain out, but can be returned to the plant later. This movement also converts the vacuum pump into an air compressor. In each size of filter plant the drain cock

and the compressed air bottle are so designed that while the filter is draining (3 to 4 minutes) a charge of compressed air at 50 lb. per sq. in. is collected in the air bottle, which is fitted with a safety valve adjusted to blow off at this pressure. The movement of the control cock from "Drain" to "Clean" releases the compressed air in reverse through the unit and blows out the collected sludge from the orifice at the bottom of the filter.

The "Stream-line Renovator" has been applied successfully to the continuous purification of lubricating oil in steam turbines, Diesel and gas engines, and also motor cars.

An interesting series of samples of oil taken from the crank-case of a Swift 14 h.p. car is available showing the condition of the oil at 60, 90, etc. miles up to 23,000 miles. It is most interesting to compare the last sample with one of oil taken from the crank-case after a run from Coventry to London without the filter attached.

In fairness to other makers of oil recovery plants, the methods described are not put forward in the sense that they are the best or the most suitable, but because they have been personally investigated by the author. The results obtained have proved that with a well-designed plant and a properly organised system it is possible to recover oil so that it is not only equal to its original quality, but in some instances is improved, and that considerable economies can be effected by the saving in the cost of lubrication and greater efficiency attained by prevention of wear on the bearings and moving parts of engines and plant supplied by clean oil.

Much useful information can be obtained by the study of the methods used in the United States, where probably the question has been given more attention than in this country. The reports of the Air Service already referred to are of great interest; 50% of the engineers stated they preferred the reclaimed oil, and the other 50% agreed it was as good as the original.

A number of analyses are given showing the results of tests on recovered oil:—

These indicate quite satisfactory results. No. 1 was a low quality oil, and the loss on heating figure is much too high. As a rule oils of good quality give much better results with oil recovery than those of lower grade. Where large units are concerned and considerable quantities of oil are in circulation it is becoming a general practice to purify the oil on the continuous system. This is to be strongly recommended where possible, as it ensures that the oil is kept clean and in good condition.

On the merits of the different methods of treating oil for recovery and the type of plant used, opinions will naturally differ. Important factors to be considered are the initial cost, working cost, class of oil to be recovered, and the results obtained. Where oils such as cylinder oil and oil for crank-case internal-combustion engines have to be dealt with, it will be found that they present rather more difficult problems than others. Some of the solid matter, such as carbon, exists as very fine particles in a colloidal state, whilst emulsification will be found to some extent, so that with the ordinary method adopted for oil recovery it is not possible to make a satisfactory purification without some preliminary treatment in the wash tank; with motor oil it will inevitably be found that the viscosity has been lowered by dilution of the fuel. Some means must be provided for heating the oil and treating it so that the diluent is removed. Light body oils such as dynamo and transformer oils do not present the same difficulties, and are, in consequence, dealt with far more easily. Some means must be provided for heating the oil, and where the oil can be either spread or finely divided there is always a better chance of the purification being more complete.

It is very important that transformer oil should be quite free from moisture, although the results of tests published on this subject indicate that moisture itself is not so injurious as when impurities are present, a drop in the dielectric strength being caused where water and a small quantity of hygroscopic fibres are present. For use with transformers it is recommended that an oil-recovery plant of a portable nature should be employed, as purification can take place on the spot and there is no risk of contamination.

To obtain the best results from any system of oil recovery, it must be properly organised. In large works the various oils used should be classified and standard specifications drawn up showing the maximum and minimum variation allowed in the different tests, and an oil chart should also be prepared showing what grades of oils are to be used in different parts of the plant. By this means recovered oils which fail to pass the standard test for the original oil can be used in other places where it would be quite satisfactory. Suitable arrangements must be made for the collection of the used oil in receptacles correctly labelled, and for the delivery of the recovered oil in clean vessels.

It is advisable to make an examination of the oil before recovery in order to determine what treatment is necessary to get the best results, and when treated and purified, chemical analysis should be made and the results compared with the original specification. If found satisfactory, a certificate, together with details of analysis, should be furnished by the chemist to the engineer responsible.

There is no doubt that many engineers are reluctant to use recovered oil, and they should not be unduly blamed for taking care that the lubricants they use are suitable for their purpose; it is up to the chemist to treat them with the utmost confidence, and by working together get the most economical results from the recovered oil.

So far as costs are concerned, these will vary according to the nature of the oil recovered and the treatment necessary, but the maximum cost, even on the most difficult oil, should not exceed 6d. to 7d. per gal., and will vary in some instances from 1d. to 2d. per gal.

The author wishes to express his thanks to the Industrial Waste Eliminators, the Super-Centrifugal Engineers, Ltd., the Alfa-Laval Co., Ltd., and the Stream-Line Filter Co., Ltd., for illustrations and the loan of lantern slides; also to Mr. C. S. Garland for much useful information.

CANADIAN INDUSTRIAL NOTES

The financial statement of the Spanish River Pulp & Paper Mills, Ltd., for the fiscal year ending June 30, 1927, shows a gross profit of \$3,065,261, which compares with \$3,743,448 for the preceding year. After deducting interest on funded debt, taxes, etc., a net profit of \$1,715,112 was left, compared with \$2,195,902 the previous year. Dividends of 7% per annum were paid to preferred and common stockholders. The balance to profit and loss has been increased, and now stands at \$7,174,948; general reserve stands at \$1,834,848, and debenture reserve \$7,151,983. During the year the company acquired a holding in the St. Anne Paper Co., Ltd., at Beauport, Quebec.

The Maple Leaf Refining Co.'s plant at Coutts, Alberta, has commenced the production of gasoline and other petroleum products.

The Fraser Companies, Ltd., will enlarge the pulp and paper establishment at Edmonton, N.B., by the addition of plant for an increased daily output of 250 tons sulphite pulp, and increase paper and board output to a corresponding extent.

SCIENCE AND INDUSTRY*

By GEORGE GRAY, M.Sc., F.I.C., M.I.Chem.E.

Neither the scope of the chemist nor the application of scientific principles in industry is, as yet, fully appreciated. The chemist might be of considerably greater value in industry if he would realise that a knowledge of chemistry alone is not sufficient to equip him for the development of industry, wherein lies a mass of problems yet unsolved—problems which require for their solution the best brains the nation can produce. There is but a very fine dividing line between science and industry: The underlying principles of the one find ready application in the other, always provided such principles are viewed in the broadest possible sense.

Science may be defined as "systematised knowledge"; industry may be defined as "the steady application to any business or pursuit." I believe that in the future it is only the industry built on the more scientific foundation that will continue to prosper. Others will be swallowed up by the competition which their apathy is certain to attract.

Industry is full of opportunities for the use of analysis and synthesis. Like any concrete science it can only be based on measurement, whilst the powers of deduction inherent in the well-trained chemist find immeasurable scope in its midst.

Up to the present the chemist has shown too little appreciation of the value of his scientific training in formulating methods of control in industry. Matters have been left either in the hands of the accountant, who must necessarily base his scheme on accountancy methods, unless he is given the help and co-operation of the chemist, or else in the hands of cost experts who have not really possessed either scientific or accounting knowledge—but have attacked their problem in the light of producing every conceivable figure relative to the process. Such systems become mere mass-producing statistical machines. Frequently, so many facts and figures are produced that the executive striving to control his plant or his process is left spellbound with no certain knowledge as to what is really happening.

Measurements in industry must be made on lines indicated by the technical man for his most effective guidance. Too many chemists and works managers in the past have tended to regard this all-important duty as beyond their sphere. They have accepted the figures produced for them and tried to control their operations by secretly-made check tests.

I will refer more fully at a later stage to the problem of measurement in industry. For the present, I wish merely to stress its importance, to note its close relationship with scientific principles and, finally, to suggest that it should be followed up and studied by the chemist.

I very strongly maintain that the first duty of chemical science to the world at large is the basic development of pure chemistry. This great task is largely in the hands of our Universities. Just as legislation lags in the vanguard of social and political thought, so do the scientific developments of to-morrow lag in the van of the research work of to-day. The man with the capacity for pure research is rare, although it would appear that

* Chairman's address to the Bristol Section on March 3, 1927.

given the encouragement and the opportunity the supply of workers might exceed the demand. It is the duty of industry to associate itself more closely with pure research work, and whilst results cannot be expected to provide an immediate commercial return, they must undoubtedly provide an insurance for the future, yielding a high return to industry in years to come.

The average chemist appears to regard industry as the most likely market for his services. Undoubtedly industry requires a limited supply of trained chemists to carry on applied research and technical experimental work in connexion with the working up of new processes or the development and improvement of old ones.

There is, however, knocking at the door of industry an already great and an ever-increasing body of chemists awaiting absorption. Some pass through works laboratories into our factories and prove able to apply their scientific training in the control of plant and people; many fail in this application.

It is often asked whether industry requires men trained in our universities or whether the man trained in the environment of factory life is not more likely to succeed. I would say without hesitation that this question entirely depends, not only on how the university training is given, but much more so on how it is received.

What industry requires above all else is the man who can take the broad view, the man who has, and can express, the reasons for the opinions which he holds. The man who has the personality to support those he is working under, and the power to engender the respect of those working under him.

The chemist who is to find scope in industry is not necessarily the man with the highest degrees. His academic training should, above all, have taught him how to teach himself. It should have taught him the powers of investigation and deductive reasoning. Almost as important as his technical training, however, is the use he has made of his academic environment. He should have learned on the playing fields, before he enters industry, what it means to "play the game," and what it means to "play for his side." He should have been instrumental in furthering the social work of his university during the period of his residence.

It naturally must not be assumed that a man who has devoted his whole academic life to the social side is what industry requires, but there is a *Via media*. We learn at school to play a "straight bat," and to "push in the scrum." This teaching must be continued at the 'varsity, and its greater application in industry is bound to become of far-reaching importance in the future.

I do not for one moment suggest that all these attributes cannot be possessed by the factory-trained man. He may play his games as keenly for his club as for his 'varsity. He may gain his experience of organisation and debate by means of a multiplicity of societies and clubs. He may extend his technical knowledge by an excellent system of night classes and university extension lectures.

I think, however, the university man has this advantage. He comes into industry having acquired not only the power to teach himself, but with a fresh outlook, and should continue his factory training, deducing the

why and the wherefore of his various problems step by step. The factory-trained man may tend, though he by no means always does, to accept everything that he is taught without full analysis.

On balance I would say that a university training should be an advantage in industry. Many large firms of to-day are endeavouring to equip a limited number of their young employees with such a training, and are providing the means. It is to be hoped that it will be found possible to increase these numbers in the future.

It does not seem to me that there is any great need for alteration in the general university curriculum. It would appear, however, to be helpful if our professors would assist the student who has industry as his bent to derive the greatest possible benefit from the environment of his academic life.

On entering the factory, the chemist can only be fitted to take his place in industry by realising that progress depends upon "taking his coat off to it." This is the one and only way of appreciating the difficulties of plant and process. It is also the one way of gaining the confidence of management and workers alike.

As the chemist is proceeding with his factory training, his mind will be dwelling upon the problems of the industry with which he is associated. His immediate problem is that of manufacture, but the day has arrived when the chemist should turn, and is turning, his mind to a consideration of other industrial problems. Gone are the days when the chemist can afford to say that it is the sales department that is always wrong and the works that are always right. Gone are the days when the industrial chemist can afford to stand aloof from accountancy, from advertising, and from the multifarious problems of industry. The day has arrived when we look to the technical man to try and take into his reckoning these essential factors and give or take just a little, so that his works organisation and management may blend with the policy of the business as a whole.

There are times in every industry when the problem of manufacture is outstanding; times when some new product has been discovered or some new process evolved, creating a temporary monopoly. At such times the works must be strained to satisfy the demand created. It is more general, however, for the strain to be on the sales department, and the works manager is called upon to run his plant and his process below maximum output, yet at the same time at minimum cost. We may regard manufacture as the work done in converting raw materials into finished product. In the process certain losses must occur. The efficiency of the conversion depends upon its cost. It is the measurement of this cost and the sound appreciation of the results that make for progress.

We are all of us, I think, clear that it is useless to weigh a body having a large air displacement to limits beyond the weight of air displaced without making the necessary allowance. It is surprising how little this principle is ever applied in industry. It is surprising how little the "definition of the object" is ever considered when making a calculation of yield or cost in the factory. In the measurement of factory cost, "definition of the object" plays a most important part. There are too many cost systems in industry to-day which lack this

"definition" and which tend to produce a mass of statistics as equally unscientific as unsound.

We have all of us learned the wisdom in research of spending at the outset a considerable time in investigating our problem. All available literature must be studied, and a research plan must be drawn up before laboratory work is commenced. How similar are conditions in industry, whether we consider the problems of manufacture, selling, accounting, or advertising. Time spent in investigation is always amply repaid.

It is interesting to note the work which is being done by our sales and advertising experts to-day. Potential markets are being investigated in quite a scientific way. Methods of recording sales statistics are such as would fascinate the keenest research chemist as bases for the application of deductive reasoning. Salesmanship and advertising themselves are arts, yet we are becoming accustomed to the phrases "scientific salesmanship" and "scientific advertising." Their claim to be scientific, and I think it is a just claim, lies in the work of investigation, which is applied in deducing the facts upon which the methods employed are finally adopted. I feel sure that the chemist in industry would very greatly benefit by a study of how these problems have been approached by the commercial man. There is yet ample scope for development in this field of work, and I am convinced that the scientifically-trained man will be able to apply his training in considerably speeding up progress in this direction.

In a similar way "scientific management" is the application of the science of investigation to the art of management. There appears to me to be the same link between the science of investigation and the art of application as there is between the library and the laboratory. We may even go further and regard science as the investigation, and industry as the application. I would imply, therefore, that the chemist in industry must first of all determine by investigation his plan of campaign.

His first thought must necessarily turn towards the question of measuring his cost. He must analyse his problem and determine what component costs should be measured and within what limit of experimental error he is able to work. He should aim at the measurement of those costs only which will definitely enable him to control his process, and which will indicate lines of improvement. Unnecessary cost determinations are not only valueless but often misleading. In viewing the cost problem the chemist should eliminate constants and carefully define variables. It should be regarded as axiomatic that the simpler a cost system becomes the more efficient it is. Such a system, therefore, should be economical to operate.

One might enlarge at great lengths on the pros and cons of various methods of determining cost, but the object of these remarks is principally to establish the importance of cost determination in so far as the chemist in industry is concerned, and to stress the necessity for basing all determinations made on scientific and mathematical lines.

It will be obvious that the measurement of cost must be aligned to some standard. The generally accepted basis is to measure the cost per unit and compare this

with a previous performance. I am convinced that "cost reduction" can better be effected by building up "empirical standards." The compilation of such standards requires the most careful consideration. The scope provided for the analytical mind is immense. Deductive reasoning is called upon at every turn. It is readily possible to construct on paper the probable happenings in any process over any reasonable period of time, and justify every figure used in so depicting it. It is the investigation work leading up to the construction of this picture, which, in my opinion, is the true science of management.

Having carefully investigated his problem and depicted it in cost form, the executive is able closely to follow the subsequent results, and to see whether or not he is operating at the desired efficiency.

In my opinion, a cost system should be so simple and so economical to operate that weekly returns can be obtained, and with a cost week ending on a Saturday, the results should be available the following Wednesday, so that they may be used whilst the information they have produced is, so to speak, still "red hot." The cost system which produces results weeks after the event is, to my mind, more likely to do harm than good.

A careful investigation of his cost statistics will continually be turning the mind of the executive to a consideration of the type of organisation he has adopted. Organisation must be looked upon as a means of propulsion, and consequently each branch of such organisation becomes a driving force, and the resultant of these forces represents the efficiency of the organisation. Although these forces cannot be measured mathematically, they may be graphically depicted by means of an organisation chart showing graphically the complete working of the organisation.

It should be the duty of every executive to depict his organisation by means of such a chart, which may be regarded as little more than a family tree. The chart may be used to measure the departmental costs of an organisation, and to be of real value must essentially be complete.

Organisation is no exception to the axiom that the strength of a chain lies in the strength of its weakest link. It is only by the most careful consideration of an organisation chart that overlap in authority and control can be detected, and that the final disposition of responsibility can be laid down. It is a common fallacy to suppose that because each department of a business is efficiently operated the organisation as a whole is efficient. Upon investigation of any business one usually finds a weakness at the junctions of executive control, and the larger the organisation the more difficult it becomes to ensure a high efficiency of departments *inter alia*.

This problem, which is a very real one in every industry, should appeal to the scientifically-trained man, and its solution best lies with such a man who combines with this training the necessary personality to practice and apply the "golden rule," and thus engender in all around him a real desire to pull together.

The only way to eliminate inter-departmental inefficiency is to promote trust and to dispel fear. There has been, in the past I fear, too much thought given by

many in managerial positions as to how best they could protect their own skins rather than how best they could foster the development of the organisation as a whole. Conversely I say most emphatically that too many manufacturers have encouraged this stupid outlook. Let us hope the day is at hand when we shall be able to say definitely that the chemist in industry, at any rate, realises that it is the resultant force that counts, and that he is pushing his full weight in the scrum.

I have dealt with the control of the plant and the process by cost determination and the control of the organisation by means of a carefully-prepared organisation chart. There remains the control of the people. Generally speaking, the principles which apply in the case of the management apply equally in the case of the workers. We must promote trust. We must dispel fear. We must, above all, apply common sense, and give a "square deal." I always regard workers as capitalists in industry. Their greatest asset is their capacity to earn wages. The amount of their capital invested depends upon the effort which they put into their work, and it is on this effort that they should receive their dividends in the form of wages. The worker is always happiest when he is paid by results, provided the basis adopted is a fair one.

We have suffered considerably in the past by badly-set piece-rates being cut, or by the savings obtained by improved working being pocketed by the manufacturer. I maintain that the workers' holding in our industries should be a participating holding, and that they should receive in extra wages their fair share of economies effected. I would again refer to the work being done by our sales organisers. The successful men in this field have all realised and are putting into practice this very principle.

I would conclude with the enunciation of four principles which I have always found of real value. They are as follows:—

- (1) The authority to issue an order involves the responsibility to see that it is properly carried out.
- (2) A wise policy is of more avail than a large plant; good management than perfect equipment.
- (3) We have no right morally to decide as a matter of opinion that which can be determined as a matter of fact.
- (4) The be-all and end-all of good management is to have the right thing at the right place at the right time, and to know how it got there.

CANADIAN PULP AND PAPER

A United States paper manufacturing company has acquired control of the Kootenay Pulp & Paper Co., and proposes to erect a 200 ton mill near Nelson, B.C., to make bleached sulphite pulp, at an outlay of about \$3,000,000.

The third machine of the Canadian International Paper Company's Gatineau (East Templeton) newsprint mill is operating, and the mill is now daily producing over 450 tons paper. A fourth machine will soon be in operation.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

COAL CLEANING CONFERENCE

Copies of reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, are still obtainable.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

SUSPENSION OF ENTRANCE FEE

The Council has decided to continue the suspension of the Entrance Fee during the year 1928.

ABSTRACTS IN APPLIED CHEMISTRY

It has been arranged to supply members of the Society with reprints of the Abstracts of Applied Chemistry, printed on one side of the paper only, at the price of £1 for the year 1928.

Applications for these, accompanied by the appropriate remittance, should reach the General Secretary before the end of the present year.

CHEMICAL SOCIETY'S LIBRARY

Members of the Society of Chemical Industry are reminded that they are entitled to consult the Library of the Chemical Society, Burlington House, Piccadilly, W.1, and to borrow books therefrom.

The Library is open daily from 10 a.m. to 9 p.m. Saturdays from 10 a.m. to 5 p.m. The Library is closed on Bank Holidays, the day following, and on such other occasions as the Council may direct.

ROTHAMSTED LIBRARY

By the courtesy of the Lawes Agricultural Trust, any member of the Society of Chemical Industry, on presenting a card from the General Secretary, shall be allowed access to this Library. The rules of the Library preclude journals and periodicals from being sent out, and these are, therefore, always accessible.

A catalogue of the journals and periodicals is in the Society's Offices at Central House, and may be consulted there by members.

DEATHS

Bostock, George H. (elected 1922), c/o Chief Factory Manager, Department of Labour, Spadina Crescent, Toronto, Ont., Canada. Chemist. On August 1, 1927.

Hyams, Godfrey M. (elected 1897), 309, Sears Building, Boston, Mass., U.S.A. Mines Manager. On October 7, 1927.

Smith, Albert W. (elected 1905), The Case School of Applied Science, Cleveland, Ohio, U.S.A. Professor. On March 9, 1927.

AMERICAN SECTION

The November meeting of the American Section of the Society of Chemical Industry was held on November 4, 1927, in the Rumford Hall of the Chemists' Club as a joint meeting with the New York Sections of the American Chemical Society and American Electrochemical Society

and American section of the Société de Chimie Industrielle. Dr. L. V. Redman presided. About 125 members and guests attended a dinner in the club dining room preceding the meeting and about 250 attended the meeting.

The principal speaker of the evening was Mr. F. R. Wadleigh, former Fuel Administrator of the United States. Mr. Wadleigh's paper on "Preparation of bituminous coal: its scope and significance to the user" covered the subject from the mines to the point of use. The paper will be published in the *Journal of the Society* at an early date. Dr. H. J. Rose, a research chemist for the Koppers Company, outlined the "Importance of coal preparation in the manufacture of gas and coke" and illustrated his subject by slides of good and poor coke. This paper will also be published in the near future.

LIVERPOOL SECTION

A joint meeting of the Liverpool Section and the Liverpool and North Western Section of the Institute of Chemistry was held in Liverpool University, on November 18. Dr. Alfred Holt was in the chair, and the attendance numbered about 100. An address was delivered by Dr. A. E. Dunstan, entitled: "Modern improvements in petroleum refining."

The lecturer discussed briefly modern methods of fractional distillation, pointing out that in the early days of the industry the necessity for sharp cutting had not arisen, but with the advent of the motor car and the increasing demand for motor spirit, refiners had been compelled to extract the maximum gasoline possible from the crude oil. He described the modern equipment, consisting of a tubular heater from which the vaporised oil was flashed into a bubble tower. The overhead distillate from the column is gasoline, and from various decks down the tower kerosene, gas oil, wax distillate are drawn, and a residue of pitch runs away from the bottom. He drew attention to the importance of maintaining an adequate reflux ratio and presented diagrams indicating the entire absence of overlap in the fractions.

Modern cracking plant was briefly described, and the importance of cracking in the production of maximum gasoline yield was indicated. The refining of various cuts was gone into, attention being paid to those processes in which sulphuric acid is eliminated. Details were given of the hypochlorite method, the Edlebaum method and the Sharples method, bauxite and vapour-phase treatment by adsorption. Finally, the manufacture of lubricating oils was dealt with, and the methods of Steinschinder and Schultz were described.

A cinematograph film was shown of the methods in use in Persia for drilling, refining oil, transport and so on.

The meeting concluded with a cordial vote of thanks to the lecturer, proposed from the chair and seconded by Prof. T. P. Hilditch.

SOUTH WALES SECTION

At the joint meeting held with the Institute of Chemistry on November 18, an interesting paper was read by Mr. G. E. Hider, M.I.Mech.E., A.M.I.C.E., M.I.E.E., on "The engineer-chemist and his influence in engineering economics." The chair was occupied by Mr. C. M. W. Grieb, B.Sc.

Great stress was laid on the need for the economic analysis of engineering propositions, and the fact was emphasised that engineering divorced from economics was no longer engineering. There was, however, a tendency to overdo the questions of economics in engineering, and it was essential to realise the exact meaning as applied to engineering, lest the academic type of mind, influencing professional examinations, should deem it necessary to inflict a long course of useless study on the engineering graduate because of the acknowledged need of economic analysis.

Having stressed the point that the word "economics" should be correctly interpreted so far as the subject must be included in the training of an engineer, the lecturer proceeded to discuss the relation of the engineer and the chemist in industry. It was necessary carefully to dissect all the factors; also it was necessary to see that, whatever the skill or knowledge possessed of specific phases, no one person possessed that specialist knowledge of all the phases which went to build up a great enterprise. To locate and define the duties of the engineer and the chemist, the lecturer discussed the series of acts leading to industrial propositions, which were divided as follows: (1) Conception of the enterprise. (2) Investigations to determine the volume of service which may be required. (3) To obtain capital. (4) To design and prepare plans for any structures that are necessary. (5) To build the structure and machines. (6) To operate the structure and machines. (7) To sell the resulting productions.

The engineer and the chemist could now be placed in the enterprise. They need not be concerned in the conception of the enterprise—that may be the idea of a man who has no knowledge of engineering or chemistry. They must certainly take part in the investigation to determine the volume of business to be done, and they would assist in obtaining capital, because their estimates of capital expenditure, probable results, etc. were essential. They would take part in the building of the structures and machines, and the operations would be largely in their hands. They could take part in the final operations in the sequence of acts leading to the satisfaction of public wants, i.e., the selling of the productions.

In regard to this last act, as the chemist and the engineer took a greater part in this, so would there be a greater regard for accuracy in statements regarding probable results due to installations of the resultant productions of the series of acts outlined.

The lecturer commented on the uselessness of the works chemist contenting himself with the casual sampling and testing of boiler flue gases, and asked that it be realised that unless such an analysis was made with a full examination of all the concomitant factors, it was a useless operation. The works chemist should have a comprehensive knowledge of the thermal side of his subject, as this was intimately bound up with the success of the chemical processes which it was his duty to control. The endeavour to put flue gas analysis into correct perspective was intended to indicate to the works chemist that if his knowledge of boiler plants was limited to the analysis of flue gas, then he must depend on others.

for more vital data, and accordingly he could not contribute to the demand for cheap steam.

It was suggested that this lack of co-ordination and collaboration between specialists contributed to the tragic spectacle of Great Britain sending envoys all over the world to obtain information of progress in industries in which Wales was the pioneer, and stressed the point that in South Wales there were chemists, metallurgists and engineers possessing complete knowledge of the fundamentals of their own science, and yet, so complete was the lack of collaboration, that whilst South Wales stood still, foreign competitors forged ahead with revolutionary methods of manufacture.

There was much evidence in engineering history that prosperity spoiled perspective. The thermal cycle of the so-called Diesel engine was common knowledge in Great Britain at the time British engineers were making as much money as they liked in supplying steam engines and boilers to the mines in the Rand; they were too prosperous to spare time or money to investigate the possibilities of the "Diesel" cycle, and their prosperity so completely dimmed their vision that at the present time British manufacturers built only a very small percentage of the total crude-oil engine horse-power. They were overtaking the foreigner in this phase of engineering, and many beautiful designs were being built by British manufacturers, but had our manufacturers had the foresight to get qualified chemists and metallurgists to solve the early difficulties, we should have led the world in this phase of engineering, and thus have reduced the hardships and financial losses which a period of unparalleled depression in the engineering industry had created. It was vital to recognise that no balance sheet could represent the true position of affairs of an industrial organisation which did not take into account the obsolescence of prevailing processes and of the fundamental facts on which such processes were based.

Further instances were given of the British scientists, researches benefiting the foreigner because of the refusal of the British manufacturer to appreciate the results of fundamental research, and it was pointed out that vast volumes of business had left Britain because of two factors:—(1) The failure of manufacturers to regard the obsolescence of processes as a concrete liability, and (2) the failure to link up the results of fundamental research with that series of acts which lead to the economic accomplishment of any specific enterprise.

An interesting discussion followed, in which Messrs. George Madel, C. A. Seyler, Dr. MacNair, Prof. Coates, Dr. Ramsay, and the Chairman took part.

CALENDAR OF FORTHCOMING EVENTS

Dec. 2.—Oil and Colour Chemists' Association, Manchester Section. Milton Hall, Deansgate, Manchester, at 7.30 p.m. "Application of methods of dyestuff analysis to the examination of pigments and lakes," by Prof. A. G. Green. Annual Dinner on Dec. 3.

Dec. 2.—Society of Chemical Industry, Manchester Section. Engineers' Club, 17, Albert Square, Manchester, at 7 p.m. "A new diagnosis of the coal trouble," by J. A. Bowie.

Dec. 3.—Western Junior Gas Association. Visits to (a) Stapleton Road Works—Gas-drying plant. (b) Canons' Marsh Works—Automatic C.W.G. plant. (c) Barton

Street—Stove and meter workshops of the Bristol Gas Company. A short descriptive paper on each visit will be given.

Dec. 5.—Institution of the Rubber Industry, London Section. Engineers' Club, Coventry Street, W.1. "Efficiency methods in the rubber industry," by W. W. Hamill.

Dec. 5.—Society of Chemical Industry, London Section. Rooms of the Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. "Automatic analysis of liquids and its application to control of water-softening plants," by Dr. H. S. Hatfield.

Dec. 5.—Royal Society of Arts, John Street, Adelphi, W.C.2, at 8 p.m. "Alloy steels, their manufacture, properties and uses," by Prof. H. C. H. Carpenter.

Dec. 6.—Society of Chemical Industry and Institute of Chemistry, Edinburgh and East of Scotland Sections. The Pharmaceutical Hall, 36, York Place, Edinburgh, at 7.30 p.m. "Electro-synthesis," by Prof. Sir James Walker.

Dec. 7.—Society of Chemical Industry and Institute of Chemistry, Edinburgh and East of Scotland Sections. Joint meeting with the Glasgow Section, and with the Scottish Section of the Institution of the Rubber Industry. The Cadorna Restaurant, Union Street, Glasgow, at 7 p.m. "Some features of sulphur for rubber manufacture," by Dr. D. F. Twiss. "Naphthas and their uses," by C. Chapman.

Dec. 7.—Society of Chemical Industry.—Nottingham Section. "The indole group of the alkaloids," by Prof. R. Robinson.

Dec. 7.—Society of Public Analysts, Burlington House, Piccadilly, W.1, at 8 p.m. Ordinary Meeting. The following papers will be read:—Demonstration of apparatus:—(1) "Apparatus for determining benzoic acid in foods," by G. W. Momer-Williams. (2) "Sodium flame for polarimetric work," by T. McLachlan and A. W. Middleton. (3) "Oil bromide films and their use in determining the halogen absorption of oils," by H. Toms. (4) "Tests for impurities in ether," by G. Middleton. (5) "Arsenic in coated papers and boards," by H. J. Stern.

Dec. 7 to 9.—Institution of Chemical Engineers. Conference at the Chemical Society's Rooms, Burlington House, Piccadilly, W.1. (*Particulars of the Conference were given in Chem. & Ind., Nov. 25, 1927, p. 1104.*)

Dec. 8.—Society of Dyers and Colourists, Midlands Section. University College, Nottingham, at 7.30 p.m. "Effect of light on dyed cotton and artificial silk fabrics," by F. Scholefield.

Dec. 9.—Society of Dyers and Colourists, Manchester Section. Jointly with the Manchester Section of the Institution of the Rubber Industry, at 36, George Street, Manchester, at 7 p.m. "Colouring of cold-cured rubber," by W. E. Sanderson.

Dec. 9.—Biochemical Society. Royal School of Mines, South Kensington, S.W.7, at 4.45 p.m. (1) "On the presence of vitamin A and provitamin D in yeast fat," by H. Henderson Smith, M. Hume and J. S. MacLean. (2) "Dephosphorylated methylhexosides derived from hexosediphosphoric acid," by W. T. J. Morgan and R. Robison. (3) "Organic phosphates from rabbit's muscle," by J. Pryde and E. T. Waters. (4) "Chemical changes taking place in the proteins of muscular tissue when passing into rigor," by H. R. Hewer, H. Jarran, and S. B. Schryver. (5) "The basic hydrolysis products of certain plant proteins, and the method of separation," by H. J. Holman and S. B. Schryver. (6) "Relationship of pectin to hemicellulose," by E. J. Candlin and S. B. Schryver. (7) "Studies on the nutrition of pigeons," by E. C. Grey. (8) "Estimation of chlorides in biological fluids," by R. K. Christy and W. Robson. (*Date altered from December 5.*)

INSTITUTION OF CHEMICAL ENGINEERS

The following is an extract from the Report of the Board of Examiners on the Examination for Associate-Membership, June—July, 1927:—

The holding of the second public examination in chemical engineering in this country in June—July of this year, not unlike the first, has revealed features which call for comment.

In preparing the questions, no attempt was made to depart from the standard which was set in the examination of 1926. On the contrary, the questions were designed to test not only the knowledge of the candidates in the matter of fundamentals, but to ascertain their ability to attack some of the ordinary problems with which a chemical engineer is faced. While some of the questions concerned some special aspect of the technology of a particular industry, others invited a decision on aspects relating to the solution of typical chemical engineering problems and the application of fundamental chemical engineering knowledge and economics.

The work of some of the candidates reached a much higher level than in 1926, and ability has been shown in the application of physical-chemical and engineering principles to the solution of given problems.

There is still, however, a tendency to ignore the specific points in respect of which information is sought, and for the replies to be of a general or descriptive character, and unnecessarily diffuse.

In future examinations it is recommended that questions bearing on the "outline of training" should be confined to three written papers, and that the fourth should be assigned to the preparation of a simple working drawing.

The second examination has again revealed that most of the candidates are lacking in a knowledge of heat transfer.

CHEMICAL SOCIETY

Prof. W. A. Bone, F.R.S., delivered a lecture entitled "Gaseous combustion at high pressures," on November 24, the President, Prof. H. Brereton Baker, C.B.E., F.R.S., occupying the chair.

The lecturer introduced his subject by referring to the new factors which must be considered in relation to high-pressure explosions. We must, he said, remember not to regard our terrestrial chemistry as more than a small fragment of the whole story; we must keep our minds open to the reception of knowledge accruing from a study of gaseous interactions under conditions which, until recently, would have been regarded as abnormal. After all, as Prof. Eddington has said, it is rather terrestrial conditions which should be considered abnormal seeing that, apart from the interstellar cloud which is at the moderate temperature of $15,000^{\circ}$, some nine-tenths of the matter of the universe is above $1,000,000^{\circ}$. Astrophysicists find that under "ordinary" conditions matter has rather simple properties, and chemists now realise that, had the pressure of our atmosphere been a few hundred times as great as it actually is, their own branch of knowledge would disclose a state of affairs differing in various ways from that to which they are accustomed.

Unexpected results had emerged from the experiments

on combustion under pressure; since the chief difference between conditions of high and low pressure lies in the absolute conditions of the interacting molecules, it might be anticipated that factors, the operations of which chiefly depend on such concentration, would become more dominant as the pressure rises. The value of the investigations lies in the accentuation of the operation of factors the influences of which are either masked or overlooked at the ordinary pressures; the increased density causes an increase in the rate of chemical change, involves a depression of cooling and dissociation effects, and may affect both the emission and the absorption of radiation during the explosion. With the remark that the more important experiments envisaged by the first section of the work, dealing with hydrogen-air, carbon monoxide-air, and methane-air mixtures, at initial pressures up to 200 atm., are now nearing completion, and that the next section would be concerned with initial pressures between 200 and 1,000 atm., Prof. Bone proceeded to describe typical experiments on the explosion of carbon monoxide-air mixtures, and to contrast the results with those obtained with hydrogen air mixtures in similar circumstances, paying tribute to the skill and devotion of the late Mr. W. A. Haward, and of Drs. D. M. Newitt and D. T. A. Townend, his chief collaborators.

Illustrating his descriptions with photographic and diagrammatic lantern-slides, the lecturer dealt first with the apparatus in use at the Imperial College of Science and Technology: the spherical bombs withstand pressures up to 2,000 atm., and a cylindrical bomb, which withstands pressures up to 1,200 atm., has been fitted with quartz windows and successfully used for spectrographic observations in experiments developing pressures up to 500 atm. The arrangement of the Petavel recording manometer and its optical accessories was also described. The behaviour of theoretical hydrogen air mixtures when exploded at 50 atm. is in striking contrast with that of carbon monoxide air mixtures; the pressure in the former case rises in about 0.005 sec. to its maximum (about 400 atm.) and almost immediately begins to fall and to assume the character of a cooling curve, whilst in the latter case the maximum pressure (about 410 atm.) is reached only after 0.18 sec., the pressure beginning to fall only after a considerable interval. Replacement by hydrogen of a very small percentage of the carbon monoxide in a theoretical carbon monoxide-air mixture greatly accelerates the pressure increase when the initial pressure is 50 atm.; this result is ascribed to the counter-acting effect of hydrogen on nitrogen "activation," and to the fact that hydrogen is a potent catalyst of carbon monoxide combustion.

The discovery of the new phenomenon of nitrogen "activation" in carbon monoxide-air explosions at high initial pressures was next mentioned, together with the abnormal effect of increasing the initial pressure in such explosions. The production of nitric oxide in presence of excess of oxygen is a pressure effect, consequent on the nitrogen "activation," occurring during the "cooling period." Finally, Prof. Bone said that the spectrographic evidence proved, *inter alia*, that (i) steam does not function chemically, but carbon monoxide reacts

directly with oxygen in carbon monoxide-air explosions, (ii) the radiation emitted in such direct interactions is strongly absorbed by either carbon monoxide or nitrogen, and (iii) in a carbon monoxide-excess-air explosion at 25 atm. initial pressure, no nitric oxide is formed during the actual explosion period, although more than 2.5 per cent. of nitrogen peroxide may be present in the cooled final explosion products.

Proposing a motion for a vote of thanks to the lecturer, Sir R. Robertson, K.B.E., F.R.S., said that the study of reactions under pressure was now assuming great industrial importance. In his investigation of these fundamental reactions, Prof. Bone had developed a new technique, and one not devoid of danger. The speaker referred to the effect of the density of loading of high explosives on the pressure changes involved, and remarked that progress depends on the recognition of abnormal results. The motion was seconded by the Treasurer, Prof. J. F. Thorpe, C.B.E., F.R.S., and carried with acclamation, the President also conveying the thanks of the meeting to Drs. Newitt and Townend. Prof. Bone made a brief acknowledgment.

INSTITUTE OF FUEL

A two-days' conference was held at the Institute of Electrical Engineers on November 23 and 24.

On November 23 the Presidential Address was delivered by Sir Alfred Mond, who, after referring to the amalgamation of the Institute of Fuel Technology and the Institute of Fuel Economy Engineers, said he regretted to announce that Sir William Larke, owing to the many duties involved in his position with the National Federation of Iron and Steel Manufacturers, had been compelled to resign the chairmanship of the council. A successor had been secured whom he was certain would be received with general acclamation, namely, Mr. Frank Hodges, who, of course, knew the fuel problem from every possible angle. Speaking of the Institute itself, Sir Alfred said the membership of the new body showed an increase over the combined membership of the two original bodies, but it was not desired to stand still, and therefore he urged that everyone should do his best to secure new members. A class of "collective members" had been established, and already some of the most progressive and largest firms in the country had joined this class. The object of increasing the "collective membership" class was to enable the subscription to be maintained at its present low level to the ordinary members. Every constituent firm of Imperial Chemical Industries, Ltd., was a "collective member" of the Institute.

Regulations were being drawn up governing the membership, which it was intended to maintain at as high a standard as possible. Monthly meetings had been arranged in London, and would be extended to the provinces, and at the present time it was intended to issue a quarterly journal to be followed later by a monthly journal, which would contain a bibliography of the fuel literature of the world. He hoped that the Institute would develop the advisory side of its work and become more or less authoritative for those who were endeavouring to obtain help in fuel problems, and who had not the technical assistance at hand which was

at the disposal of the larger companies and institutions. After giving a brief outline of the subjects to be discussed during the meeting, Sir Alfred Mond made a few remarks on the wider aspect of the fuel problem. Some little time ago he accepted the chairmanship of the National Fuel and Power Committee, which was set up by the Government to investigate the possibility of economies in fuel and power in this country. The committee had not issued a report, although he hoped that in a not too distant future one would be issued. He did not wish to forestall the conclusions of the committee, but there were a few things which had struck him personally in the investigation. One was that we still have a great deal to learn in handling coal, and although it would be unfair to say that our collieries are inadequately equipped, there were, nevertheless, many old-fashioned ones. Take anthracite coal, for instance, an expensive material which obtained a lower price the smaller the size, every endeavour seemed to be made in the handling of it to reduce it to powder, and to turn a product worth 40s. per ton into duff worth only 5s. per ton.

The methods of washing and screening coal generally in use to-day seemed to be extraordinarily crude. Having been brought up in the more delicate chemical industry, he was horrified to see the primitive methods adopted at so many collieries, but he was told that these were the only methods which could be adopted. Fortunately, many new ideas were being discussed and tried, and he had taken a little personal interest in a new washing process which, as far as it had gone on a semi-technical scale, had proved itself very remarkable as it enabled the ash to be reduced from a very high figure to about 2%. This process was about to be installed at one of the collieries he was interested in, and after it had been working for some time on a commercial scale more would be heard about it. There was nothing more terrible than to contemplate the amount of money spent in this country in carrying ash about in the coal from one part to another. It was obvious, too, that by a reduction in the ash content of the coal before it left the colliery it would be possible to produce qualities of metallurgical and other cokes which might have a very vital effect upon metallurgical practice.

Some evidence had also been given to the Committee as to the position of the coke industry in this country, and that evidence might be published one day. If that were done people would be rather surprised, because it was not satisfactory. There were in this country many small and antiquated coke ovens, and when these were compared with some of the bigger installations abroad it was realised that in this industry there was still a great deal to be done. When one compared the work done in Germany before the war, and continued ever since, with the work done in this country, it made one blush. In Germany they had a magnificently equipped central institution to deal with all the fuel problems of the various collieries, with a very large number of able men to deal with them. Here, however, we were still relatively backward. Attempts at co-operation were becoming more successful, but the amount of money that people in this country seemed to consider adequate to spend on research was absolutely fantastic. The Germans dealt

in what they called mass research work. If the Germans were endeavouring to obtain coal from oil they would put up not two pieces of apparatus, but one hundred, so that in studying the problem they could get one hundred variations right away. This obviously saved very much time, and eliminated their difficulties very much more quickly. These results were obtained in Germany not because the Germans were better people or more brilliant than we; it was due solely to their more systematic working and the extent to which they spent money on research. Dr. Bosch, the head of the I.G., had told him that he was satisfied if they invented something new every ten years, but in this country the position was usually that the wretched research man, badly equipped, was asked by the Board within a very few months whether he had not produced something of commercial value, and he was probably dismissed if some results were not shown on the profit and loss account. Unless the industries of this country took these problems seriously to heart they would find themselves in a very short time displaced in the industries of the world, simply because of the higher technical efficiency and better scientific work carried out in other countries. It was impossible to stop the march of progress of science and ideas, and there was no reason why we in this country should not do as well as any other country in developing scientific progress. We had in this country plenty of able scientific men, and it was up to those who were leading the industries of the country to take every possible advantage of the facilities offered for research work on a continuous and growing scale. In the coal industry, for instance, there was a very wide field for development on these lines. The Germans were actually using pulverised fuel in Diesel engines. If this was developed, it seemed likely that those who were obtaining oil from coal could retire into obscurity, because compared with the use of pulverised fuel in this way the production of oil from coal was a laborious and expensive method. In America, too, they were already beginning to think of transporting coal in the pulverised form for various purposes. All this demonstrated in what a state of flux was what might be thought one of the most stable industries of the world, and it held out great hope for the coal industry. Only by cheaper fuel, better utilisation of fuel, cheaper power and cheaper products generally would it be possible for the nation as a whole to increase its spending power and improve the prospects for the industries of the country.

The following papers were then read:—

"Operating experiences with 1300 lb. steam pressure," by J. Anderson.—This paper is a record of the actual operating experiences with a water-tube steam boiler of 240,000 lb. evaporation per hour installed at the Lakeside Power Station, Milwaukee, U.S.A., and generating steam at a pressure of 1300 lb. per sq. in. The period covered is eleven months, and the boiler was in service for 57% of this period, including one continuous run at full capacity for 50 days, which improved overall plant efficiency 4%. The author concludes from his experience that such a unit may be kept in service as long as desired, and states that an order for an additional 1300 lb. equipment will soon be placed. There have been

experienced, however, major troubles, and the paper describes them in detail and also the remedies. These troubles were confined almost wholly to tube failures from scale formation and tube corrosion troubles. No difficulties appear to have been experienced with pining, or mountings. For high-pressure service it is positively necessary to provide nearly scale-free make-up because: (1) 150° F. higher water temperature than in 300 lb. boilers exists. (2) Higher metal stresses equivalent to an additional 150° F. higher tube temperature. It is also necessary to maintain an appreciable caustic alkalinity, and reduction of oxygen in the feed water, to below 0.1 c.c. per litre to prevent corrosion in high-pressure boilers fed with evaporated make-up.

"Preheated air for boiler furnaces," by P. H. N. Ulander.—To-day the air preheater is being recognised as a necessary adjunct to the boiler. This change has largely been the result of economic pressure, for since the end of the war the tendency in most large boiler plants has been towards an increase in rating coupled with the use of higher steam pressures and temperatures. Higher steam pressures mean increased flue gas temperatures with consequently larger potential heat losses, and in addition the increase in the use of bled steam for feed heating has helped to make the task of the economiser more onerous. Owing to the relatively low price of the heating surface of the economiser when compared with that of the boiler, the installation of a small economiser is frequently advantageous, but for higher boiler efficiencies, in those cases where the load factor and cost of fuel merits it, the addition of an air preheater is desirable and frequently essential. It is suggested that the tendency of the future will be for an increasing number of air preheaters to be installed in connexion with economisers of decreasing size. Moreover, the trend of development will probably be towards an increase in the exit temperature of the flue gases from the boiler, and with the collateral rise in feed temperatures the installation of an air preheater of high thermal efficiency will be essential. The air preheater is also finding an increasing use for the aiding of the combustion of low-grade fuels, especially with those containing a large percentage of free moisture. Air preheaters are developing along two distinct lines, namely, the regenerative and recuperative types, and the relative merits of each of these types are now known. The prejudice against the use of highly preheated air is mainly due to lack of proper appreciation of some of the problems involved. If due and proper care be taken in design then no trouble need be expected with comparatively high air temperatures, as is proved by practical experience. The air preheater enables a reduction to be made in the capital cost of the complete steam generating unit and in the cost of generating the steam itself. Air preheating and the preheaters themselves have passed out of the experimental stage.

"The British coking industry and some of its products," by R. Ray, B.Sc., M.I.Chem.E.—The first section of the paper illustrates how American and Continental nations have been developing their coking industries, whereas Great Britain has been practically stationary since 1914. In discussing the means for the rehabilitation of the industry, stress is laid on the

necessity for a closer relationship between the coking industry, the gas industry, and the iron and steel trades. For the production of a suitable blast-furnace coke at a price which would leave a profit for the producer and, at the same time, permit the ironmaster to compete on fair terms with the Continent, amalgamations of coking interests in certain areas must be brought about. This would mean the production of coke in large centralised batteries of coke ovens of a minimum capacity of 1000 tons per diem, instead of in many small and uneconomical plants which are operating to-day. The essential conditions attached to the successful operation of centralised coking plants are as follows:—(1) Railway freights to-day prohibit the transport of coking slacks to a central plant: aerial ropeways provide the solution to this difficulty. (2) No central battery of ovens can be a practical proposition unless the bulk of the valuable high-calorific gas produced is disposed of at a satisfactory figure. Apart from the advantages of cheaper coke and vast supplies of high-calorific gas, the modernisation of the coking industry would mean the installation of plant to produce accurately graded coke. The necessity for this is recognised by all conversant with blast-furnace practice, whilst it is of almost equal importance if the domestic smokeless fuel market is to be successfully developed. To produce such a coke—one which will stand transport and rough usage—the study of coals and the results obtained by blending them must be given much more serious consideration. The importance of the grading of coke and the scientific blending of coals is recognised and practised abroad, but in Great Britain the former is carried out in a most haphazard manner in most cases, whilst the latter is practically unknown.

“National electricity supply,” by Sir Philip Dawson.

On the Continent of Europe and U.S.A. it is realised that modernisation of industry is synonymous with electrification, and this and the process of amalgamation and co-operation of similar productive interests has gone on far more rapidly than with us. Use of electricity is largely neglected in our coal mining and steel industry, although many individual examples of most efficiently equipped and operated works exist. In Germany 40% of the electricity is produced by cheap low-grade brown coal. In this country large reserves of coal remain unworked owing to poor quality: they could be utilised for producing power at the pit's mouth, and this would enable coal resources now lost to be utilised. Much of this coal could be used to produce oil, the residue being used for generating electricity. Our mining industry cannot be made successful except by linking up the modern methods of power production and fuel utilisation. In this country much coke-oven blast-furnace gas, owing to lack of co-operation and co-ordination, is still wasted. The co-ordination of coal mining, by-product plant, and generation of electricity would benefit the whole community. Hitherto such an arrangement has been difficult, as the electric supply is an essential part of the scheme: no organisation existed which would take the electricity produced and dispose of it. The creation of the Central Electricity Board has now solved this difficulty. By linking up as provided by the 1926 Act, spare plant will be reduced to 10%, in addition to which, owing to the better operating

conditions resulting from interworking, the cost of production will be materially reduced.

“The conversion of coal into oil by the Bergius method,” by J. Ivon Graham and D. G. Skinner.—By the Bergius process, at the present rate of consumption, the liquid fuel needs of this country could be met by the treatment of approximately 15 million t. of raw coal per annum, *i.e.*, about 6% of the total amount raised. Obviously, therefore, hydrogenation cannot be a panacea for the ills of the mining industry, even should the process be economically feasible. Since 1922 investigation of the process as applied to British coals has proceeded in the Mining Research Laboratory at the University of Birmingham. These experiments, since 1924, have been financed by the British Colliery Owners' Research Association, and have, in the main, confirmed Bergius's results. The aim of these experiments has been, and is, to ascertain with more exactitude than appears to have been the case with those carried out by the Bergin A.G., which type of coal and which constituent of the coal substance undergo hydrogenation most readily. It appears from the researches carried out in the Mining Research Laboratory that those coals falling into the parabituminous division of the Seyler classification, and having a carbon/hydrogen ratio between 15.5 and 16.5, give the highest oil yields. With coals of this class the process might possibly be worked with profit at the present time. There seems no doubt, however, that it is only by further research into the influence of constitution of coal upon ease of hydrogenation, and the nature of the products obtained, as well as in the engineering technique of high-pressure work, that the more general application of the process can be made a commercial success.

“Measurement of steam flow in works practice,” by H. C. Armstrong, A.M.I.C.E., and T. Nordenson, C.E.—The paper is divided into two parts, in the first of which the authors, having discussed the necessity of measuring the steam used in works of all kinds, indicate a practical method of so doing. The measurement of steam flow by means of a portable meter or a differential manometer and a special orifice fitting is advocated. Designed to work on the principle that the drop in pressure of a fluid flowing through an orifice inserted in a pipe, due to the constriction of the orifice, is proportional to the quantity flowing, a special diaphragm, which has been largely used by the authors, is described. Having fitted the arrangement, the differential pressure head is measured by means of a manometer described in the paper or with a steam meter of the ordinary type. The paper includes a series of charts from which it is possible to read off the correct size of orifice plate for any ^{at} in a pipe of given size, and also to convert the ^{one} ential pressure head into direct flow figures without ^{ce} intervention of elaborate calculations. These ^{ch} which have been translated into British units by ⁴ authors, are taken from the work of M. Backstrom, ^{is} well-known Swedish engineer, a translation of ^{val} paper on the subject forms the second part of the ^{auth} paper.

“Liquid fuels other than petroleum,” by A. E. D^{stan} and H. G. Shatwell.—Despite the continuous ^{on} coveries of new deposits of crude petroleum, the ^{alt}

increase in production and the recent heavy falls in prices, intensive searches for indigenous liquid fuels in coal-bearing countries have been in progress for some years, whilst important investigations have been conducted in which the conversion of solid into liquid fuels is the chief aim. These activities are influenced to only a small degree by economic considerations, but have their source almost entirely in political and strategic movements. The economic factor involved arises from the fact that solid fuels introduce handling costs of the first importance. For this reason coal might be increasingly gasified at the pit-head and the railroads utilised as means for laying pipe lines to the great towns, the gas being conveyed under high pressure to the existing low-pressure receivers. The carbonisation of coal at low temperatures gives smokeless solid fuel as the main product and primary tar as a by-product the latter being obtained in yields of about 16 gals. per ton of coal carbonised. Tar-acids cannot be employed as motor-spirit, though they have been used with some success in Diesel engines: their chief value lies in the possibility of converting them into benzol hydrocarbons. The oils remaining after removal of pitch and phenols resemble "cracked" rather than natural petroleum, and their refining must be modified accordingly. The authors have found that primary tar straight-run spirit possesses an anti-knock equivalent equal to that of benzol, whilst the spirit obtained by cracking the tars also has anti-knock properties. Hydrogenation of coal by the Bergius process gives an average yield of 140 gals. of liquid products per ton of coal. The economics of berginisation will depend largely upon the cost of hydrogen, and it is for this reason that Bergius has recently evolved an ingenious method for recovering hydrogen from the gases leaving the plant. The liquefaction of coal may also be effected by transforming the raw material, after a preliminary carbonisation, into water-gas, which is treated under different conditions to give a variety of products. Thus the Badische Co. and Patart manufacture synthetic methanol by passing water-gas at high pressure and at about 420° C. over certain catalysts from which iron must be rigorously excluded. Fischer, on the other hand, prepared synthol under similar conditions of temperature and pressure, but by the employment of iron coated with alkali. Both

methanol and synthol possess properties which militate against their value as motor-spirits, but they will readily find application in other directions. Finally, by passing purified water-gas over iron, nickel or cobalt at atmospheric pressure and at temperature of 150-270° C., by Fischer and Tropsch have succeeded in preparing a product which consists entirely of hydrocarbons, and is of all intents and purposes synthetic petroleum.

Vertical intermittent chamber ovens," by N. J. Lake, F.R.S., O.B.E., A.M.I.C.E.—The object of this paper is to give particulars of recent developments in Germany in the vertical intermittent chamber oven system of carbonisation, which is a rational development of the intermittent vertical retort. The results of carbonising a Durham coal in intermittent vertical chamber ovens

are given and tabulated in a similar way to the results given by Hardie (in a paper read before the Institute in December, 1926), and although too close a comparison

must not be made between these two tables of results, an examination does show that the intermittent system is able to achieve results as good as, if not better than, those achieved by systems generally employed in this country. A number of advantages of the intermittent chamber oven system is enumerated. A short description of a modern intermittent chamber oven plant is given. Attention is drawn to the reasons why the intermittent chamber oven system has been preferred on the Continent to the continuous systems so successfully developed in this country. Sufficient information has been given in the paper to demonstrate that their employment is not, as might be suggested from the intermittent nature of their operation, a retrograde step, and that they deserve the most serious consideration of those interested in the carbonisation of coal. Large plants of this type are now under construction in this country.

"The chemical study of processes involving the carbonisation of coal by internal heating," by Prof. M. W. Travers, F.R.S.—By drawing up a heat balance of the total heat entering and leaving the system in a process of complete gasification or of carbonisation of solid fuel it is frequently possible to determine whether a particular system can or cannot be carried out. If such a method were universally adopted, only a very small proportion of the processes for carbonisation and gasification of fuel which are patented would ever be put forward. Unfortunately, there is no agreement as regards the values of the important constants used in the compilation of thermal balance sheets. Assuming, however, the known data available, taking customary specific heats of gases and specific heat of coke calculated from the thermal capacities of graphitic carbon and silica, the thermal requirements for (1) low-temperature carbonisation of coal by producer gas, (2) low-temperature carbonisation of coal by superheated steam; and (3) manufacture of water-gas from coal, have been calculated. With respect to low-temperature carbonisation of coal by producer gas, in no single paper are the data for any particular experiment sufficient for complete analysis, but from a compilation of published data the quantities can be deduced which are required to effect the carbonisation of coal at 600° by producer gas or superheated steam. In the manufacture of water-gas from coal it is shown that the quantity of water-gas required to carbonise one ton of coal equals 63,500 cb. ft. An output of 70,000 cb. ft. per ton of coke probably represents the limit attainable with blue water-gas practice, and then only when 6-7% CO is permitted: 55,000 cb. ft. is probably a very good average for carburetted water-gas practice. It therefore follows that the quantity of water-gas which can be produced in a process for the complete gasification of coal is under any circumstances insufficient to effect the carbonisation.

BRITISH ASSOCIATION OF CHEMISTS

The 10th Annual Meeting was held on November 26. Prof. G. T. Morgan, F.R.S., the President, being in the chair.

The Treasurer, Mr. W. H. Woodcock, in presenting the Financial Report, pointed out that the improved financial position of the Association had been maintained since

a small balance remained in hand which would be used for very special requirements. The unemployment benefit fund was now in a satisfactory position and owing to the increased subscription, had paid out this year £1,035 in benefits, the largest sum ever disbursed in one year.

Mr. S. R. Price, M.B.E., Chairman of Council, in moving the adoption of the Annual Report of the Council, said that the great increase in prestige of the Association did not mean that its efforts to increase its membership and influence ought to be abated. On the contrary the fact that a large amount of work remained to be done should encourage every member to do his utmost to increase its influence.

The following officers were elected to serve for the coming year. *President*: Prof. G. T. Morgan, O.B.E., D.Sc., F.R.S.; *Vice-Presidents*: Sir Max Muspratt, Bart., Wm. E. Kay, F. Scholefield, M.Sc., C. S. Garland, A.R.C.S., B.Sc., F.I.C., M.I.Chem.E., Prof. E. C. C. Baly, F.R.S.; *Hon. Registrar*: E. H. Rodd, D.Sc.; *Hon. Treasurer*: Wm. H. Woodcock; *Hon. Gen. Secretary*: H. T. F. Rhodes, M.I.E.I.

With great regret the resignations, owing to pressure of work, of Prof. Heilbron as Vice-President and of Mr. R. Brightman as Hon. Editor were accepted.

Considerable discussion arose in connexion with the resolution of the London Section:—"That the London Section recommends that the Political Rules Part I. XXIII (1/13) be deleted, and cease to have effect as from November 26, 1927." The London Section had suggested that, since the Association was registered as a Trade Union only for convenience, it was improbable that it would desire to canvass candidates for Parliament before election at any time, and that since in any case the rules would have to be altered in view of the new Trade Union Bill, it was probably most convenient to delete the rules altogether. On the other hand it was held that although the Association did not desire to follow the ordinary Trade Union policy, the deletion of the rules might hamper its parliamentary interests at some future date. The resolution, upon being put to the meeting, was lost by a narrow majority.

The resolution of the Birmingham Section "That the Council is hereby instructed to publish a Register of all members of the B.A.C. containing their names and addresses as at January 1, 1928," was discussed. The Council was agreed as to the principle of publishing a register, but it was contended that the whole legal question as to who should have access to the register would require to be investigated, and practical considerations such as expense ought to be considered. Upon the resolution being put to the vote, the Chairman giving the general ruling that reference back of resolutions for amendment would require their reconfirmation at another general meeting, the resolution was carried by a narrow majority.

In his address, Prof. Morgan discussed the question of the title "chemist," and touched upon the various difficulties legal and practical which arose in this connexion. The unemployment benefit fund had done work of which not only the Association, but the whole profession, ought to be proud. Of the legal aid fund

something had already been said, but he thought that the results were of an importance which extended beyond the benefits conferred upon the individual recipient. Adequate legal protection increased the status of the whole profession. The Association was a small body as yet, but its potentialities were very great and before it he felt sure was a great future.

The Annual Dinner which took place in the evening was most successful in spite of transport difficulties due to fog.

The principal guest of the evening, Mr. Irons, of the Ministry of Labour, was unfortunately absent, owing to a severe chill, but in proposing the toast of the Ministry of Labour Mr. S. R. Price referred to the cordial relations which had been established between the Association and the Government Departments with which it had been in contact.

The toast of the "Association" was proposed by the General Secretary, who alluded to the growth of the Association, and to his belief that it would do much to unite the profession of chemistry.

In his reply Prof. Morgan mentioned to the important work the Association was doing in impressing upon the public the importance of the work done for the community by the chemist. When the question of legal status arose it had to be remembered that those who were not chemists had to be consulted. It was very important, therefore, that the Association's policy should be directed to this end. It had been, and was being, thus directed. The question of registration and title was intimately connected with this matter.

Dr. E. F. Armstrong, in proposing Kindred Societies, said the chemist required a banner with a strange device. On one side ought to be the hexagon: as to that on the other he would allude to it later. One had to consider the great things the chemist had done, from the first grouping after knowledge of the alchemists through the atomic theory to the wonderful achievements of physical chemistry. Again, in the department of organic chemistry, the chemist built up out of the meanest elements things of utility and beauty. Upon the other side of the banner he thought ought to be inscribed a representation of the flapper. Upon her fingers were synthetic stones made by the chemist; there were her silk clothes and stockings, made by the chemist, there was scarcely anything she used which the chemist did not help to produce. It was a great and splendid thought, this power of the chemist to use his patiently acquired knowledge in the service of humanity, beauty and utility. It meant that the profession had always a greater and greater future before it. As to Kindred Societies the ideal was in his opinion that there should be in the end only one society. It was with pleasure that he proposed the health of Kindred Societies for as long as they existed.

Dr. P. Haas, proposing the toast of "the Officers," alluded to the excellent work done by all officials of the Association in the past year. Mr. H. W. Rowell replied.

At the conclusion of the dinner a presentation was made to the General Secretary in acknowledgment of his services to the Association. Mr. Rhodes then replied in a short speech.

CORRESPONDENCE

"RESEARCH AT HIGH PRESSURE"

SIR,—Your editorial "Research at high pressures" ought not to suggest "Research at high pressure" to a well-ordered mind. But it did to mine.

Like the man who asks you to deal with the economics of honey and cane sugar in ancient times, I would like to see an editorial from you—not on honey, but on "Research at high pressure." Research is spreading in many, but not in all directions. I am of opinion that the establishment of the research associations and of the big chemical combine will very greatly restrict the amount of research work conducted by the individual firms comprising or contributing to combines and associations. Will the advantages of centralisation compensate for decentralisation in the old system? Is it better to have one large and well-organised laboratory than to have several small ones in keen, scientific and commercial competition with each other? I doubt it.

Since you will write editorials that appeal to the chemist in the street, you must carry the penalty of being bombarded by any faddist who, like myself, wants to see his pet subject in print.

But if this must go in print please

Call me

"PERCY"

PERSONAL AND OTHER ITEMS

We are glad to learn that Mr. W. J. U. Woolcock, who has been *hors de combat* for a short time, will be able to resume his work again about a week hence.

At a meeting of the Senate of the University of London, on November 18, the resignation of Prof. E. C. Williams from the Ramsay Chair of Chemical Engineering, tenable at University College, was accepted as from the end of the second term of the session 1927—28.

The title of Professor of Chemistry in the University of London has been conferred upon Dr. J. F. Spencer, in respect of his post as head of the Department of Physical Chemistry at Bedford College.

Dr. L. J. Spencer has been appointed Keeper of Mineralogy in the Natural History Museum. Dr. Spencer has edited the "Mineralogical Museum" since 1901, and is the author of numerous publications on mineralogical and crystallographical subjects.

Dr. J. Colvin and Mr. R. S. Bradley, B.A., have been appointed demonstrators in inorganic chemistry and Dr. J. Sugden has been appointed research assistant and demonstrator in refractory materials in the Fuel Department in the University of Leeds.

At Cambridge, Mr. C. Rimington, B.A., of Emmanuel, has been re-elected to the Benn W. Levy research studentship in biochemistry for one year.

Major T. H. Crozier, H.M. Chief Inspector of Explosives, and Prof. J. S. S. Brame, of the Royal Naval College, Greenwich, have been appointed by the Ministry of Transport to hold an enquiry into the proposal to allow petrol ships to proceed higher up the River Thames than Thames Haven.

On the invitation of the Commonwealth Government, Sir Arnold Theiler, K.C.M.G., D.Sc., the South African veterinarian, and Dr. J. B. Orr, D.S.O., M.C., M.D., D.Sc., Director of the Rowett Institute, will visit Australia next year to consult with the Australian authorities in regard to Australia's pastoral problems.

Mr. S. T. Harman has joined the board of British Cyanides, Ltd.

Mr. T. Tertius Aikman has joined the boards of the Angela Nitrate and Santa Catalina Nitrate companies.

Mr. H. W. Hardinge, president of the Hardinge Co., of York, Pa., has been awarded the Edward Longstreth Medal by the Franklin Institute for his invention of a rotary air classifier, known as the Hardinge reverse current air classifier.

Dr. Vogler has resigned, on the grounds of ill-health, from his post as general director of the syndicate which controls the entire coal output of the Ruhr district.

The death is announced, at the age of 73, of Dr. P. Jeserich, a well-known German expert in legal chemistry.

The death is announced of Sir A. F. Pease, a noted Durham coalowner, who was a director of the National Benzole Company and other concerns.

The late Mr. R. G. Murray, of Gorton, Manchester, chemical manufacturer, left £19,020.

I.C.I. Research Council

In order to provide a co-ordinated body for determining the lines of general industrial research, Imperial Chemical Industries, Ltd., has established a research council, which held its first meeting on December 1. The research council will be presided over by Sir Alfred Mond, chairman of the company, and the other members will be:—Dr. G. C. Clayton, M.P., Colonel G. P. Pollitt, and Mr. J. Rogers (directors); Major F. A. Freeth, F.R.S., Dr. E. F. Armstrong, F.R.S., Dr. R. E. Slade, Mr. H. A. Humphrey, and Sir Frederick Keeble, F.R.S., all of whom are associated with Imperial Chemical Industries, Ltd., or its subsidiary companies; Prof. F. G. Donnan, F.R.S., Prof. Robert Robinson, F.R.S., Prof. W. A. Bone, F.R.S., Prof. F. A. Lindemann, F.R.S., Dr. E. K. Rideal, and Major A. E. Hodgkin, secretary. The main function of the research council will be advisory, and it will act as a clearing house for ideas. Steps have also been taken for following up all promising matters which may come before the council. The council will provide close *liaison* between industry and the universities, and will promote both long-distance scientific industrial research and research of the so-called purely academic type.

Vitamins in Margarine

The Research Laboratories of Lever Brothers, Ltd., announce the development of a process by which vitamins A and D can be incorporated in margarine. A vitamin margarine made by Planters Foods, Ltd., an associated company of Lever Brothers, is on sale throughout the country under the registered name "Viking."

British Standard Paints

The British Engineering Standards Association has recently issued three new British standard specifications for Brunswick or chrome green oil paste for paints,

indian reds (pale, middle and deep) for paints, and black oxide of iron for paints. They contain clauses regulating the composition, together with standard reception tests, for the purchase of these materials, together with Appendices giving methods of carrying out the tests. Copies of the specifications (Nos. 304, 305 and 306, 1927) can be obtained from the British Engineering Standards Association (Publications Department), 28, Victoria Street, London, S.W.1, or from the publishers, Messrs. Crosby Lockwood & Son, 7, Stationers' Hall Court, London, E.C.1, price 2s. 2d. each, post free.

Proposed Institute of Indexing

"It is proposed to form an 'Institute of Indexing,' to encourage the compilation of efficient indexes to books, papers, etc., to promote their intelligent use by the public, to maintain a register of qualified indexes, and to give advice where needed. Particulars may be obtained from Mr. W. R. Douglas Shaw, 'Beaufort,' Mornington Road (Chingford, London, E.4)

The Chemists' Club (N.Y.)

The transmutation of the Chemists' Club (New York) from tenant to owner of its building in East 41st Street, New York, was celebrated by a banquet on October 26. President Wagner, after reading congratulations from chemical and engineering organisations throughout the country, said that 98.8% of the stock of the Chemists' Building Company was now owned by the Club, the greater part of it having been given by the original sponsors of the project.

Coal-tar Dyes in the U.S.A.

The total production of coal-tar dyes by 61 firms in the United States in 1926 was 87,978,624 lb., an increase of 2% over the previous year. Sales in 1926 totalled 86,255,836 lb., valued at \$36,312,618, at a weighted average of 12 cents per lb., or 10% less than the corresponding average price during 1925. The average price in 1917 was \$1.42 per lb. The competition between domestic dye manufacturers was severe, and resulted in 16 fewer firms engaged in production in 1926 than in 1925. Imports of dyes into the U.S.A. during 1926 represented a decrease of 10% in quantity and 11.5% in value, as compared with 1925. Exports of dyes in 1926 increased slightly in quantity, but decreased 11% in value, as compared with 1925.

Mellon Institute of Industrial Research

From the annual report of the Mellon Institute of Industrial Research, it appears that 102 fellows are now working at investigations connected with 58 industrial fellowships. Nearly £120,000 was paid during the year in support of research under the fellowship scheme, so that the total sum provided for fellowship research by companies etc. during the first 16 years of the Institute will not fall far short of £1,000,000. The development of the work has made it necessary to provide for research in "pure" chemistry, and accordingly a department for pure chemistry (under Dr. L. H. Cretcher) and a department for analytical chemistry (under Dr. G. D. Beal) have been established.

The XIth Exposition of Chemical Industries

Visitors to the Exposition of Chemical Industries which was held at the end of September in New York

state that it was the most successful yet held. Exhibitors were numerous and there were many interesting exhibits, amongst which some of the more unusual items were as follows:—The Udylyte Co. exhibit of cadmium plating showed a metal resistant to sulphur fumes. The Matheson Co. exhibited ethylene and other liquified gases and gave a demonstration of the use of ethylene gas in hastening of ripened fruit colours on fruit. The American British Chemical Supplies Co. showed a new plastic material produced from acetyl cellulose. For the first time, a large number of displays of fatty acids, waxes, glycerol and products made therefrom were shown. The Commercial Solvents Co. exhibited synthetic methanol made in the United States. Amongst the plant shown, there were: a model wood distillation plant (Ford Motor Co. By-products Division); a cantilever filter (United Filter Co.); a new interior filter (Dorr Co.); a Monel metal tank for the transport of nitric acid (Pressed Steel Tank Co.); the new Vorce electrolytic cell (Electro-Chemical Engineering & Supply Co.); the General Electric Company's hydrogen welding process; "Vitaglass," and so on.

New Insulating Material

The General Electric Co. (U.S.A.) has developed a new insulating material composed of ground mica and lead borate. An excellent insulating material is already made from mica flakes, but the wastage of mica has been very great, for it has been estimated that only 5% of the material taken from the mines could be used. The new material, known as "mycalex," is also of interest as it is a promising outlet for the fine mica waste.

New Corrosion-resisting Material

It is claimed for a new metallurgical product, made in France by the Aciéries de Pompey and marketed under the name of "Apso," that it possesses qualities of resistance to corrosion, workability, strength, etc., similar to, and in some instances better than, nickel steel, with the advantage that it costs less.

Research in Belgium

On the initiative of King Albert and with the support of leading industrialists and financiers, a fund has been started in Belgium for the establishment of a permanent museum and a laboratory for scientific research. Important contributions have already been received.

"1914—1924"

The Académie des Sciences, in awarding the Monthyon Statistical Prize to "1914—1924—Dix Ans d'efforts Scientifiques, Industriels et Coloniaux," has "crowned" the work. This important work, published in two handsome quarto volumes under the direction of Jean Gérard, deals with the scientific, industrial and colonial progress of France during the period 1914 to 1924. It can be obtained from "Chimie et Industrie," 49, rue des Mathurins, Paris, at the price of 48s.

The I. G. and Synthetic Rubber

An impression may have been gained from reports of the speech recently made in Frankfurt by Geheimrat Dr. H. Von Weinberg, of the I.G. Farbenindustrie, that successful manufacture of synthetic rubber is in sight. This impression may be discounted by the following

translation received by the Department of Overseas Trade from H.M. Consul-General at Frankfort (Mr. V. H. C. Bosanquet) of the pertinent passage in the speech from the report appearing in the "Frankfurter Zeitung": "Through contact synthesis we shall further succeed in extracting by a more convenient method the raw materials for the synthesis of rubber and gutta percha." In another translation made at the Consulate-General in Cologne from a report in the "Deutsche Bergwerks Zeitung," the end of the sentence reads, "to produce the elements for the synthesis of rubber and gutta percha."

The only interpretation possible is that the German chemical combine with which Dr. V. Weinberg is connected has become satisfied with the progress made in its investigations towards the production of isoprene, or a related hydrocarbon, from which the rubber molecule must be built by further treatment. The reports do not mention the second and very difficult problem, that of obtaining a material which will present the essential physical and mechanical qualities of natural rubber.

German Potash Industry

The British Commercial Secretaries at Berlin state that, although the very favourable results achieved in the German potash industry during 1925 were not attained in 1926, and sales showed a diminution of some 125,500 to 1,100,000 tons, they far exceeded the 1924 sales of 843,860 tons. It is true that German inland sales, which account for nearly 60% of production, showed a reduction in 1926, but this would seem to be counterbalanced by increased sales during the first quarter of this year, largely attributable to the mild weather. Foreign sales did not develop to the extent which had been hoped, but were doubtless in some measure temporarily influenced by the change in the foreign sales organisation consequent upon the conclusion of the Franco-German Potash Agreement. Foreign sales are now undertaken conjointly by the German Potash Syndicate and the Société Commerciale des Potasses d'Alsace.

Coal Hydrogenation in Hungary

As the Hungarian coal industry is faced with over-production, attempts have been made to "liquefy" Hungarian coals. Tests with coal from the Totis mines have given excellent results and special plant is accordingly to be erected.

Agreement between the Chemical Industry and Manufacturers in Czechoslovakia

An agreement has been reached between representatives of the Czechoslovakian chemical industry and those industries using its produce, notably the glass, paper, leather, and textile industries, with the object of eliminating unnecessary competition and facilitating trade.

Stability of Acetone to Light

It is reported from the laboratory of the Holzverkohlungs-Industrie A.-G. Konstanz, that chemically pure acetone, satisfying the requirements of the German Pharmacopœia in its lack of reaction with permanganate, decolorises it after exposure to ultra-violet light. The pure material can be obtained again on rectification. Acetone of this purity should therefore be protected from light during storage.

Austrian Chemical Industry

Chemical plants in Austria number 683, employing 19,209 workmen. Among these plants the 300 in Vienna occupy 40% of all the labour employed in the Austrian chemical industry. 149 plants with 5482 workmen are situated in Lower Austria; 40 plants with 1881 workmen in Upper Austria; and 60 plants with 1518 workmen are situated in Styria. In the Tyrol there are 30 plants, and in Burgenland 5 plants.

According to the "Centralblatt für die Zuckerindustrie" the six Austrian sugar factories, which produced 79,686 tons of raw sugar during the 1926-27 campaign, will manufacture 96,550 tons this year, a figure which represents the capacity of the industry. The refineries worked up Czechoslovakian raw sugar in previous years (1926-27: 11,513 tons), but they will probably have enough home sugar this year. As the Austrian sugar factories are working to capacity there arises the question of erecting new factories. Such projects are not new, but their realisation is hindered by financial difficulties. There are projects to erect sugar factories more cheaply by adapting some vacant factories situated in the beet-growing districts, though the results from such an attempt by the Farmers' Sugar Factory in Suben were bad.

A short notice in the "Oesterreichischen Chemiker-Zeitung" reports that the chemical factory erected by the administration of the Salt Works at Hallein (Salzburg) has begun production. At present the production of this factory will amount to 1200 tons of chlorinated lime and about 1500 tons of caustic soda. As the Austrian import, in 1926, of chlorinated lime amounted to 2270 tons, a moderate import should be still required. The factory will probably produce liquid chlorine at the end of this year.

Shale Oil Furnace in Japan

An experimental shale oil furnace has been established at the Fushun collieries in Japan. It is 3 ft. in diameter and 50 ft. high, and has a capacity of 40 tons. Of the internal-heating type, it is so designed that the gas will be returned to the furnace for re-use. If this furnace comes up to expectations the plan is to build additional 40-ton furnaces. It was found that, by mixing one part of the shale oil produced at the Fushun collieries with two parts of crude Borneo oil, a product was obtained that would be satisfactory for marine purposes. An annual output of 25,000 tons of shale oil is expected.

Third Census of Production (Butter, Cheese, Condensed Milk and Margarine Trades)

In the year 1924 the amount of butter made and blended in commercial factories and creameries in Great Britain amounted to 722,000 cwt., valued at £7,005,000, compared with 422,000 cwt., valued at £2,289,000, in 1907. The total amount of cheese produced in 1907 was 73,000 cwt., valued at £187,000, compared with a selling value in 1921 of £760,000. The output of cream in 1907 was 964,000 galls., valued at £356,000, compared with a selling value in 1924 of £1,415,000. In 1924 the output of separated milk amounted to £130,000 in value, whilst the value of condensed milk, milk powder, lard compound, refined oils and acid oils in 1924 amounted

to £24,661,000. The total value of dairy produce and other goods manufactured by factories and creameries in Great Britain in 1924 was over four times that of the output in 1907, a marked increase being shown in all cases where a quantitative comparison is practicable.

The net value of the output of the factories and creameries in Great Britain engaged in the industries was £4,497,000 in 1924, the net output per person employed being, in 1924, £383, and in 1907, £159. The net output per person employed in factories and creameries in England and Wales in 1924 was £383, and in Scotland, £378. The average number of persons employed in Great Britain during 1924 in the industry was 11,747, compared with 5,100 in 1907. The total capacity of engines at the factories in Great Britain engaged in the trade was 22,857 h.p., in 1924, of which slightly over 31% was in reserve or idle during the year. The capacity returned in 1907 was 5,594 h.p. There was also recorded for 1924 a total capacity of 5,231 h.p., electric motors driven by purchased electricity, nearly 8% of which were in reserve or idle during the year. The capacity of electric generators in 1924 was 10,180 kw., against 711 kw. in 1907.

Third Census of Production (Brewing and Malting Trades)

The figures given below are of the output in 1924 and 1907 of brewers and maltsters in Great Britain:—

Products	1924		1907	
	Quantity	Selling Value £	Quantity	Selling Value £
Beer, ale, stout and porter, brewed	20,103,000 barrels of 36 gallons at 1055"	141,788,000	31,040,000 barrels of 36 gallons at 1055"	53,381,000
Aerated and mineral waters, doz. botts.	2,477,000	287,000	686,000	*31,000
Malt made for sale	6,732,000 cwt.	6,877,000	10,462,000 cwt.	6,098,000
Grains, maltummings and other offals	—	1,020,000	—	987,000
Non-alcoholic drinks, brewed	—	44,000	—	—
Liquors purchased and bottled	—	8,131,000	—	*151,000
Barrels and casks, made and repaired	—	535,000	—	292,000
Other products	—	383,000	—	130,000
Malting done on commission	—	190,000	—	87,000
Total value	—	150,273,000	—	61,314,000

* In order to avoid the possible disclosure of particulars relating to certain firms, the figures for Ireland (amounting to £17,000) were, in these cases, included with those for the rest of the United Kingdom. This sum is not included in the total shown above for the year 1907.

The amounts appearing in the above table in respect of malt produced represent only the quantity and value of malt made for sale and do not include the production of commission maltsters or malt made by brewing firms and used by them for brewing purposes. From returns received the total production of malt in Great Britain during 1924 (excepting malt made by distillers and used by them as material), may be estimated at 12,631,000 cwt., of which 6,732,000 cwt. was made for sale, the quantity made by commission maltsters being roughly 1,000,000 cwt., and the balance was made by firms for their own consumption in works.

The net output of the breweries and maltings for 1924 was £121,812,000, and the net output per person was in that year £1,816, compared with £481 in 1907, the figures in both cases being inclusive of Excise Duty. The average number of persons employed in the trade in 1924 was 67,069, compared with 78,374 in 1907, the

figures for both years, relating to Great Britain only. In 1912, a total of about 80,000 persons employed is indicated by the information received. The total capacity of engines at the works in Great Britain in 1924 was shown as 43,679 h.p., of which slightly over 19% was in reserve or idle during the year. The 1907 capacity was 57,335 h.p. In 1907, the capacity of electric motors at factories was not recorded, but in 1924, motors aggregating 57,530 h.p., driven by purchased electricity, were included in the returns. About 10% of the capacity of these motors was in reserve or idle during the year. There was also recorded for 1924 a total capacity of 7,747 h.p., electric motors, driven by electricity generated by engines at the factories. The capacity of electric generators at breweries and maltings was in 1924, 6,454 kw. and in 1907, 2,884 kw.

Improved Capillary Flow Meter for Gases

Prof. E. H. Riesenfeld has devised improved forms of the capillary flow meter suitable for all laboratory measurements of gas streams. Details of the method of calibration are given (*Chem.-Z.*, Sept. 3). These instruments are now on the market.

THE NEW BELGIAN CHEMICAL TRUST

The Union Chimique Belge, the chemical trust which has just been founded at Brussels, was formed in order to strengthen the power of the affiliated companies to compete not only in home but in foreign markets.

The new trust, possessing considerable capital, will be able to carry out investigations and develop the new processes which are essential to modern industrial progress.

It appears that the Union Chimique Belge will have a capital of 175,000,000 francs, of which 30,000,000 will be obtained by the issue of 100-franc preference shares bearing a fixed rate of interest, and the balance in ordinary shares. The preference shares will be subscribed by the Banque Industrielle Belge, La Société Générale de Belgique, La Mutuelle Solvay, and the Banque de Bruxelles. The ordinary shares will be allotted to the amalgamated companies in exchange for their shares in the following proportions: 150,000 to La Société Fours a Coke Sarnet Solvay, 60,000 to La Générale Belge de Produits Chimiques, 60,000 to La Société des Produits Chimiques de Droogenbosch, 14,000 to the Cie. des Produits Chimiques Meurice.

It is stated that the president of the trust will be M. Theunis, a former prime minister, while M. E. Janssen (of the Mutuelle Solvay) will preside over the "Comité de Direction," and M. G. Blaise and M. O. Piette will act as managing directors.

Extraordinary meetings will be held to obtain the assent of the shareholders to the amalgamation.

As the Compagnie Belge pour les Industries Chimiques owns three-fifths of the present share capital of the Société des Produits Chimiques de Droogenbosch, it has a considerable interest in the new trust; and as the Compagnie Belge, together with the Droogenbosch, the Société Metallurgique de Hoboken and the Union Minière, is interested in the Syndicat pour les Industries Chimiques, and in the Katanga Company, the chemical trust is thus assured of important outlets.

REVIEWS

MANUFACTURED GAS. By J. J. MORGAN, M.S., Ph.D.
Vol. I. Pp. 518. New York: J. J. Morgan, 1926.
Price \$7.50.

It is a somewhat remarkable fact that although in certain branches of the technique of gas production American practice may be regarded as superior to our own, the American gas engineer has been lamentably ill-provided with anything in the way of comprehensive and really up-to-date text-books. Three years ago Mr. Horace C. Porter commenced to remedy the deficiency by publishing an admirable monograph on coal carbonisation, but it has been left for Mr. Morgan to produce a really workmanlike volume in which an attempt has been made to cover not only the main, but also the many subsidiary processes which are essential features of modern gas production. The science and practice of gasmaking has, however, progressed so rapidly in the past few years, established precedents and rules have in many instances been thrown to the winds, and the research worker has applied himself with such thoroughness to the technical problems which beset the industry, that it has become a matter for serious doubt whether in the space of a lifetime any single individual could possibly assimilate all the existing information and compile therefrom a text-book which could be characterised as really complete.

At least, it may be said that Dr. Morgan and his collaborators have provided the gas engineer with a work which is more complete than anything which has hitherto been attempted, and where omissions are found, there is little doubt that they will be remedied in the second volume, which has yet to make its appearance. The earlier pages of the book, which deal with the physical and chemical characteristics of fuel gases, may be passed over as representing nothing very new; but inclusion of material of this nature is particularly desirable as it enhances the value of a book which is likely to be used largely by students as well as the matured gas engineer. The chapters which follow and which deal with the more practical aspects of gas production should be of particular utility to engineers in this country as showing the different features of design which are to be found in America and the care which is bestowed on the smallest details. It is, perhaps, rather striking to find the statement that the horizontal retort with its recent improvements in charging and discharging apparatus is still an important factor in coal carbonisation in America. One notices, too, that whereas over here the maximum number of retorts comprising a bench may be regarded as ten, in America some benches contain as many as sixteen retorts. It is not, however, difficult to realise that, when all is said and done, the American engineer undoubtedly prefers large capacity by-product coke-ovens for effecting carbonisation. More than a dozen of the largest cities now obtain all, or a considerable part, of their gas supply from these ovens, and there seems little doubt that the use of coke-ovens, in which America now leads, will play an even greater part in American gas production of the future. As to whether the retort or the oven is the more effective apparatus, so much depends upon local circumstances, and it is likely to be

many years before the English gas engineer is converted to the opinions of his American colleagues.

America, of course, is the home of water-gas, and the importance of this particular type of gas can be appreciated when it is recalled that it represents more than 60% of the total gas produced. For this reason it was only to be expected that Dr. Morgan would devote a large portion of his space to a discussion of the various plants and processes which are now utilised for the production of both blue and carburetted water-gas. Recent years have witnessed many modifications of the standard water-gas plant such as is commonly found in this country. Some of these modifications relate solely to those plants which have been developed in America for the treatment of bituminous coals—a practice which is not considered economical in this country; but many others have been adapted, for the improvement of efficiency, to the ordinary process of coke gasification, outstanding examples of which are the back run method, reversed airblast, and the Chrisman process. All these have been developed with the same idea in view, namely, that of returning to the generator heat which is not needed in the superheater and reducing the quantity of heat wasted in the wash-box.

The complete gasification of coal, regarded a few years back as the ideal process for the conversion of both coal and coke into gas in one stage, comes in for its share of attention, and it is obvious that opinion in America runs on much the same lines as that over here. Dr. Morgan sums up the situation by stating that the dream of a single-stage complete gasification process, which shall permit the recovery of by-products from bituminous coal and convert the whole of the solid matter except the ash into a gas suitable for distribution, is still unrealised, but it forms an intriguing field for research and invention. In America, of course, the situation is rather different for the reason that, two or three States apart, much higher standards of calorific value are in force; but when the time arrives that the gas undertaking is permitted to deliver such gas as it is most economical for it to manufacture and distribute there will be further opportunities for complete gasification in the cheap production of low heating power gas.

In conclusion, the author deserves the thanks of his colleagues for the pains to which he has gone to provide a work which must already be regarded as a standard. He has wisely drawn with freedom on the experience and publications of others and has freely acknowledged the sources of his information. ALWYNE MEADE

KÜNSTLICHE ORGANISCHE FARBSTOFFE. By Dr. H. E. FIERZ-DAVID. *Technologie der Textilfasern*, edited by Dr. R. O. Herzog. Vol. III. Pp. xvi + 719. Berlin: Julius Springer, 1926. Price 63 r.m.

This is a much more ambitious work than the same author's *Fundamental Operations of Dye Chemistry*, published about six years ago, and is an expansion of lectures delivered at the Technical College, Zürich. After an excellent historical introduction, in which the part played by natural colouring matters is not forgotten, and a general review, both theoretical and practical, of the dye field, the dyes themselves are treated systematically and in detail, the usual classification being followed.

On the whole, a very good balance is maintained in the systematic portion of the book, although one would expect more than a mere 48 pages on indigos and thio-indigos in comparison with 92 pages on triarylmethane dyes, 118 pages on azo dyes, and 164 pages in the anthraquinone section.

In the chapters on azo dyes it is surprising to find practically no mention of lake pigments, but the section on Rosanthenes and other fancy cotton colours from J-acid is the best account yet published. In later editions room should be found for the interesting story of dyes for acetate silk, of which the Ionamines must only be regarded as an early, if important, chapter.

Scattered throughout the book, often in small type, sometimes in footnotes, the careful reader will find numerous useful observations and hints which reveal the close familiarity of the author with the practical and technical side of his subject. It may be questioned whether a text-book is a suitable medium for the publication of new and original investigations, but no azo chemist will grudge the 23 pages devoted to the characterisation of the fission products of azo dyes, for which purpose good use is made of absorption spectra.

Although the book is intended for students of dye-chemistry, its appeal is rather to the specialist in one or other of the dye groups. The student is likely to be overwhelmed by the many pages of formulæ, and will find rather too little help from the brief general and theoretical expositions which preface them; the dye specialist will be delighted to find here a number of dye constitutions unknown to *Schultz* or the *Colour Index*—until he discovers that several of these contain serious errors (e.g., three incorrect constitutions for Algal Brilliant Violet R are given on pp. 574 and 575). The rather numerous typographical errors may be forgiven in a book of this size and complexity, and with few exceptions will readily be detected and corrected (*p*-dimethylaminobenzoyl chloride, p. 253, does not melt at 85°). The book is beautifully printed, and its interest is enhanced by the inclusion of twenty plates, of which ten are pictures of famous dye chemists. The German of the text is unusually clear and direct, and as a book of reference for practical dye technologists this work is strongly to be recommended.

C. HOLLINS

LES SUCRES ET LEURS DÉRIVÉS. By MARC CRAMER. Encyclopédie Scientifique. Publiée sous la direction de Dr. Toulouse. Pp. xiv + 349. Paris: Gaston Doin et Cie., 1927. Price 28 fr

The research school of carbohydrate chemistry at Geneva has merited the great esteem and recognition of chemists by its important investigations on polysaccharides and the anhydro-sugars, and for the series of brilliantly conceived synthetic experiments which have opened the way to a study of the vastly complex problem of polymerisation. The author of this book is therefore well qualified by his active participation in the advancement of the subject to write with experience of the problems engaging the attention of fellow-workers in the same domain. Prof. Picet communicates a delightful introduction to this volume, written by one of his distinguished pupils.

This little book presents, in a most readable and handy form, an account of the most recent developments in the chemistry of the carbohydrates. The author has expended much labour in a thorough survey of the literature of the sugars, and has given, in the course of his clear, impartial, yet critical narrative, a fascinating review of his subject. The text is freely illustrated by structural formulæ, more so than is usual in so small a book, and the reader is kept in touch with original papers by means of the frequent references given in the text and by the complete bibliography at the end. Those interested in the subject, whether research workers or students, will appreciate the simple and well-balanced form in which the matter is presented.

In this branch of the chemistry of natural products progress has been rapid during very recent years, and many of the older interpretations placed on experimental results have been profoundly changed. The task of writing the book was evidently well advanced when the new formulæ for glucose and γ -glucose derivatives were introduced nearly two years ago, a circumstance which had the effect of modifying the whole of the sugar formulæ accepted since the time of Fischer and Tollens. M. Cramer has introduced into his text the necessary revisions, although in many cases these take the form of footnotes.

Without unnecessary detail or recourse to tabular representation, the author has given a general survey of the preparation, properties, constitution, and synthesis of sugars and their derivatives, and has written in such a manner as to stimulate and retain the interest of his readers. Generally speaking, there are few interpretations of results with which one could disagree, although there are a few misprints: for example, on page 109, the formula 111b shows glucose diacetone, whereas this is referred to in the text as fructose diacetone; again, on page 173, the methylfructoside of Hudson and Brauns is referred to as a γ -form. It would have been helpful to have included an alphabetical index of subjects. The volume is a welcome addition to the collected literature of the carbohydrates.

W. N. HAWORTH

FORTSCHRITTE IN DER KAUTSCHUK-TECHNOLOGIE. By F. KIRCHHOFF. Part XIII. Technische Fortschrittsberichte. Fortschritte der Chem. Technologie in Einzeldarstellungen. Edited by Prof. B. Rassow. Pp. xi + 201. Dresden and Leipzig: Theodor Steinkopff. 1927. Price, paper, 12 m.; bound, 13.50 m.

This book is one of a series designed to present readers with a concise account of the more recent scientific and technical advances in branches of industry. It is not intended to rank as a text-book, but is written for those who are engaged in the industry and have not the opportunities for keeping abreast with the scientific and technical literature of their subject. It may be said to fulfil this purpose. The author has spared no pains to make the book complete, and it is supplied with a good index—a feature not always found in continental publications. In many respects the book may be regarded as based on our own Annual Reports, but on a more elaborate scale and covering the whole of last decade. As in our annual

Reports the first few pages of the book are devoted to a statistical review of the industry, both producing and manufacturing. This is followed by twelve technical sections dealing with latex production, production of raw rubber and so forth through the various manufacturing operations, with a final chapter on rubber testing. Many recent papers dealing with rubber are extremely complex and are difficult to abbreviate. The author has therefore dealt more fully with some researches than with others. This was inevitable, but it gives the impression of a want of balance. If the author could only have let himself go and written a book two or three times the size the result would have been more satisfactory. A few interesting details may be cited, *e.g.*, the contrasts drawn between British and American rubber machinery on the one hand and German on the other, of machines built 10 or 12 years ago and the productions of the present day. On page 171 is an illustration of the latest type of Schopper mechanical tester with the extremely ingenious modifications of the autographic attachment enabling curves for rings of different cross sectional area to be contrasted on the same sheet.

The portions of the book deserving of special mention are those dealing with fillers, recovery of solvents, synthetic rubber and artificially prepared derivatives of the hydrocarbon, and also the last section dealing with the mechanical testing of rubber. On the other hand the chapters on raw rubber and accelerators are perhaps less satisfactory than other parts of the book. The book is well provided with references to the technical and patent literature.

HENRY P. STEVENS

THE METALLURGIST'S MANUAL. BY T. G. BAMFORD, M.Sc. and HAROLD HARRIS, M.Sc., F.C.S., with a foreword by T. TURNER, M.Sc., A.R.S.M. Pp. x + 216. London: Chapman and Hall, Ltd., 1927. Price 15s.

This is not a text-book of practical metallurgy, but a collection of methods and figures useful to the metallurgist in his laboratory. It contains a fairly full account of the methods of assaying and of analysis of ores and metals, in sufficient detail to serve as a manual of analysis. Next follow the methods for determining the value of fuels, but the widely-used and accurate bomb calorimeter is not described. A section deals with the calculation of slags and fluxes in smelting operations, and this is followed by a more detailed account of pyrometric methods. More attention might have been given to the disappearing filament type of optical pyrometer, which is increasingly used, and of which several excellent British patterns are available. It is difficult to give any adequate description of metallographic methods and results in so small a space as 33 pages, and some of the photomicrographs used as illustrations are not very clear, but the practical methods of preparing microsections are well described. The closing sections contain the composition of analytical and laboratory reagents and a number of tables showing the composition and properties of technically important alloys. The printing and arrangement are clear, and there are many laboratories in which such a handy collection of metallurgical data will be found useful.

C. H. D.

PARLIAMENTARY NEWS

Iron and Steel Production

Colonel Lane Fox informed Mr. H. Williams that the amount of coal used at iron and steel works during the first nine months of 1927 was approximately 18½ million tons (including the coal equivalent of coke).—Nov. 15.

Sugar Beet

In a written reply to Mr. A. V. Alexander, Sir H. Barnston stated that under the contract arranged between the National Farmers' Union and the proprietors of the existing factories, the price to the grower for topped and washed beets delivered at factory in each of the seasons 1928, 1929 and 1930 would be 46s. per net ton of 15½% sugar content, plus an addition at the rate of 3s. for the first 1% above 15½%, and 3s. 4d. for each additional 1%. The reduction in respect of beets below 15½% will be at the rate of 3s. for each 1%.—Nov. 16.

Artificial Silk Duties

Answering Sir J. Power, Mr. Samuel stated that for the six months ended October 31, 1927, 21,524,000 lb. of artificial silk was charged with Excise Duty, compared with 14,094,000 lb. for the six months ended December 31, 1925. — November 17.

Sugar Beet Subsidy

In a written answer to Mr. Stephen, Mr. Guinness stated that the total weight of sugar produced from British beet in this country during the operation of the subsidy up to November 16, 1927, is 5,529,311 cwt. of an estimated wholesale value, duty paid, of £8,250,000. The subsidy paid has amounted to £5,385,908.—November 17.

Chemical Warfare Experiments

Sir L. Worthington-Evans, in a written reply to Mr. Cadogan, said that no horses were used for experiments at the Porton Chemical Warfare Experimental Station during August, September, and October. Experiments with animals were, unfortunately, essential in order to obtain the necessary data for ensuring adequate defence against poison gas and for evolving efficient methods of treating gas casualties. — November 17.

Safeguarding of Industries

Sir P. Cunliffe-Lister informed Mr. Ramsden that the number of applications received for safeguarding was 46. Seventeen applications had been referred to committees of inquiry, in eight of which cases the committee had reported unfavourably, in seven cases favourably, and in two the inquiries were proceeding. Safeguarding duties had been imposed in all cases recommended by the committees. In four other cases—touring cars, commercial cars, tyres and carbon electrodes duties had been imposed in recent Finance Acts. Five applications were under consideration. Of the remainder, 3 were covered by the Government's decision on iron and steel, and 17 had been rejected by the Board of Trade as failing to establish a *prima facie* case under the White Paper. — Nov. 22.

Oil Fuel Extraction

In a written reply to Mr. Wheatley, Lord E. Percy stated that it had been proved technically possible to extract oil fuel from coal, from experiments which were

being carried out at the Fuel Research Station and Richmond, and the large number of similar experiments elsewhere. It was, however, not possible for the Government to express an opinion on the commercial prospects of any process based on these experiments.—Nov. 22.

Petrol (Tetra-Ethyl Lead)

In a written reply to Mr. Hardie, Sir W. Joynson-Hicks stated that one firm in this country had lately commenced the blending of tetra-ethyl lead with petrol on a commercial scale. The Factory Department had been kept informed, and was satisfied that adequate precautions were being taken for the protection of the workers concerned in the process. There was not likely to be any danger from the handling of the spirit after blending. The whole matter would be carefully watched.—Nov. 24.

Sugar-Beet Subsidy

Mr. Guinness informed Mr. Hayes that the gross subsidy paid to November 22, 1927, on sugar and molasses had been £6,169,915. Approximately 5,791,782 cwt. of sugar and 1,222,851 cwt. of molasses had been produced. No estimate could be given of the quantity of pulp produced. In the 19 beet-sugar factories 8,400 weekly wage earners were at present employed, and the average number of hours worked daily was approximately 9.4. He had no information as to the average weekly wage paid to these workpeople.—Nov. 25

COMPANY NEWS

VICKERS, LTD., AND SIR W. G. ARMSTRONG, WHITWORTH AND CO.

Meetings of these two companies were held on November 28, at which the provisional agreement, dated October 31, 1927, for the amalgamation of certain of their important works and businesses now engaged principally in naval shipbuilding and in the manufacture of heavy and special steel and armaments, was confirmed. (Cf. CHEM. AND IND., Nov. 25, 1927, p. 1101.)

BRITISH OXYGEN CO., LTD.

An interim dividend has been declared of 9d. per share, less tax, compared with last year's interim of 6d. per share.

ANGELA NITRATE CO., LTD.

An interim dividend has been declared of 5%, less tax, being the same as last year's interim.

BRITISH CEMENT PRODUCTS AND FINANCE CO., LTDs

This company, formed in November, 1926, reports a net profit for the year to November 16, 1927, of £124,753, from which has been written off the whole of the preliminary and new issue expenses, leaving available £107,280. It is proposed to transfer £10,728 to special reserve and £24,772 to general reserve. A dividend of 15%, less tax, has been recommended on the ordinary shares, plus a bonus of 1s. per share, less tax, making 20%, and a dividend of 95%, less tax, will be paid on the deferred shares plus a bonus of 11.4d. per share, less tax, making 190%, leaving £14,780 to be carried forward, subject to income tax. During the period under review Mr. A. J. Chapman was elected to a seat on the board, and has been appointed managing director.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £30 per ton; Powder, £32 per ton; Extra fine Powder, £34 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
Lamp Black.—£35 per ton, barrels free.
Lead Hyposulphite.—9d. per lb.
Lithopone, 30%.—£22 10s. per ton.
Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.

Sulphur.—£9—£11 per ton, according to quantity. **Sulphur Precip. B.P.**—£47 10s.—£50 per ton, according to quantity.

Sulphur Chloride.—4d.—7d. per lb., carboys extra.
Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.

Vermilion, pale or deep.—6s. 3d. per lb.
Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £10 5s. per ton. Good demand.
Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal
Charcoal.—£6—£9 per ton, according to grade and locality.
 Foreign competition severe.

Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
Red Liquor.—9d.—10d.

Wood Creosote.—1s. 9d. per gal., unrefined.
Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.

Wood Tar.—£4—£5 per ton.
Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic. Crystals, 7½d.—8d. per lb. Crude 60's, 2s. 4d.—2s. 5d. per gal.

Acid Cresylic, 99/100. 2s. 11d.—3s. per gal. 97/99, 2s. 4d.—2s. 5½d. per gal. Pale, 95%, 2s. 3d.—2s. 4d. per gal. Dark, 95%, 2s. 1d.—2s. 2d. per gal.

Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.

Benzole.—Crude 65's, 9½d.—10d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 7d. per gal., ex works in tank wagons.

Toluole.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—2s. per gal.

Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.

Creosote.—Cresylic 20/24%—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7¾d. per gal. ex works. Salty, 7d. per gal., less 1½%.

Naphtha. Crude, 9d.—10d. per gal. Solvent 90/100, 9½d.—10½d. per gal. Solvent 95/100, 1s. 3d.—1s. 4d. per gal. Solvent 90/100, 8½d.—1s. 3d. per gal.

Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.

Naphthalene. Crystals, £13—£13 10s. per ton. Flaked, £14—£15 per ton.

Pitch, medium soft.—85s.—90s. per ton, f.o.b. according to district. Market firm.

Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180 3s. 6d.—5s. per gal. Heavy.—3s.—3s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 6d. per lb.

Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.

Acid H.—3s. per lb.

Acid Naphthionic.—1s. 6d. per lb.

Acid Neville and Winther.—4s. 9d. per lb.

Acid Sulphanilic.—8½d. per lb.

Aniline Oil.—8d. per lb., naked at works.

Aniline Salts.—8d. per lb., naked at works.

Anthranilic Acid.—6s. per lb., 100%.

Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—5½d. per lb.

m-Cresol 98/100%.—2s. 7½d. per lb.

p-Cresol 32/34° C.—2s. 8½d. per lb.

Dichloraniline.—1s. 10d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene. 8½d. per lb., naked at works. £75 per ton.

Dinitrochlorbenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C. 8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

a-Naphthol.—2s. per lb. d/d.

β-Naphthol.—10d. per lb. d/d.

α-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

o-Nitraniline.—5s. 9d. per lb.

m-Nitraniline.—3s. per lb. d/d.

p-Nitraniline.—1s. 8d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—8½d. per lb.

p-Toluidine.—2s. per lb., ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure. 80%—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 3½d.—2s. 4½d. per lb.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—Cryst. 36s.—39s. per cwt. Powder 40s.—43s. per cwt.; Extra Fine Powder, 42s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 6½d.—1s. 7d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 4d.—1s. 6d. per lb. Technical 11½d.—1s. per lb. Good demand.

Acid, Tannic B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Acetanilide.—1s. 6d.—1s. 9d. per lb. for quantity.

Amidol.—7s. 6d.—9s. per lb. d/d.

Amidopyrin.—8s. 6d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 6d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £31 per ton. Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—10s. 4d.—10s. 7d. per lb. Bismuth

Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—

9s. 10d.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—

8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb.

Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Sub-

chloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.

—8s. 1d.—8s. 4d. per lb. Extra and reduced prices for

smaller and larger quantities respectively; Liquor

Bismuthi et Ammon. Cit. B.P. in W. Qts.—1s. 1d. per lb.;

12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 25s. per cwt. Powder 26s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—2s. 3d. per lb. Potassium.—

1s. 10½d. per lb. Sodium.—2s. 1d. per lb. Granulated ½d. per lb. less. All spot. Large quantities at lower rates.
 Calcium Lactate B.P.—1s. 2d.—1s. 3d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ethers: S.G. 730, 10½d. 1s. 1½d. drums. Other gravities at proportionate prices.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—4s. 9d. 5s. per lb.
 Hexamine.—2s. 3d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P. 10 vols., 2s. 3d. per gal. in carboys; Winchesters, 2s. 11d. per gal.; 20 vols., 4s. 3d. per gal. in carboys; Winchesters, 5s. per gal.
 Hydroquinone.—3s. 3d.—3s. 6d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate.—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—18s.—20s. per cwt., according to quantity.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol—A.B.R. recryst., B.P., 17s. 9d. per lb. net. Synthetic detached crystals, 10s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb.; Lovig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.
 Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonal.—8s. 9d. 9s. per lb.
 Metol.—9s.—11s. 6d. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb. Less in quantity
 Phenacetin.—2s. 6d.—2s. 9d. per lb.
 Phenazone.—4s.—4s. 3d. per lb.
 Phenolphthalein. 6s. 6d.—6s. 9d. per lb.
 Potass. Bitartrate.—90/100% (Cream of Tartar) 98s. per cwt., less 2½%.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included, F.o.r. London.
 Potass. Permanganate.—6½d. per lb. spot.
 Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7d.—1s. 9d. per lb. Crystal, 1s. 8d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.
 Sulphonal.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Aubepine (*ex Anethole*).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 9d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—18s. 6d. per lb. Geraniol.—6s. 6d.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. 6d. per lb. Linalol.—(*ex Bois de Rose*) 14s. per lb.—(*ex Shui Oil*) 9s. 9d. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 17s. 6d. per lb.—(*ex Shui Oil*) 13s. 9d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—32s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb. Bergamot.—26s. per lb. Bourbon Geranium.—13s. 6d. per lb.
 Camphor.—9d. per lb. Cananga, Java, 15s. 9d. per lb. Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 10d. per lb., c.i.f. U.K. port, for shipment over 1928. Ceylon, Pure, 1s. 8d. per lb. Clove, pure 5s. 3d. per lb.
 Eucalyptus, Australian.—2s. 2d. per lb. Lavender.—Mont Blanc, 28/40%, 17s. per lb. Lemon.—8s. 6d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. per lb. Peppermint.—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood—Mysore, 26s. 6d. per lb., 90/95%, 10s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Jan. 23rd, 1928. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Dec. 8th, 1927. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Baume, Boutier, and Chambige. 30,842. See XII.
 Bennis. Furnaces. 31,094. Nov. 19.
 Brainard. Pulveriser. 30,697. Nov. 15. (U.S., 8,427.)

Gen. Electric Co., and Pochobradsky. Pulverising machinery. 30,668. Nov. 15.

Industrial Spray-Drying Corp. Processing materials by means of gases. 31,116. Nov. 19. (U.S., 1,927.)

Jackson (Doble Steam Motors Corp.). Controlling output of evaporators etc. 30,788. Nov. 16.

Loewe. Obtaining high vacuum. 30,491. Nov. 11. (Ger., 16.11.26.)

Mann. Treatment of gases. 30,870. Nov. 17.

Pink and Reynard. Appliance for filtration of slimes. 30,522. Nov. 14.

Pneumatic Conveyance and Extraction, Ltd., and Smith. Air and gas washing apparatus. 30,482. Nov. 14.

Silica Gel Corp. Impregnated gel for adsorbing water vapour. 30,918. Nov. 17. (U.S., 19.11.26.) Manufacture of catalytic gels. 30,956. Nov. 17. (U.S., 19.11.26.)

I.—Complete Specifications

31,106 (1925). Jaubert. Liquefaction of gases. (244,168 12,349 (1926). Whatmough. *See* XII.

15,962 (1926). Bubar. Separating dust from gases (261,706.)

17,052 (1926). Baume, Chambige, and Bontier. *See* XII.

17,758 (1926). British Dyestuffs Corp., Baddiley, and Chapman. Manufacture of absorbent materials. (280,262.)

19,479 (1926). Keavell. Dehydration and kindred treatment of gases etc. (280,268.)

19,728 (1926). African Selection Trust, Ltd., Boise, and Degenhardt. Disintegrating or mixing apparatus. (280,276.)

20,068 (1926). Riley Stoker Corp. Pulverising apparatus. (260,952.)

31,725 (1926). White (Wright and Young). Separation of solids from liquids. (280,389.)

13,638 (1927). Chem. Fabr. vorm. Schering. Manufacture of colourless melted products. (272,875.)

14,314 (1927). Schwartz. Radiation pyrometers (280,454.)

*23,802 (1927). Lurgi-Ges. Producing adsorption media (280,505.)

*30,020 (1927). Zeiss. Colorimeters. (280,552.)

*30,202 (1927). Studien-Ges. f. Gas-Ind. Conveying and consuming liquid gases. (280,569.)

II.—Applications

Coley. Combustion of fuel. 30,541. Nov. 11.

Evans, Stanier, and South Metropolitan Gas Co. Manufacture of coal gas. 31,140. Nov. 19.

Forsans. Oven for distillation etc. of solid fuels. 31,124. Nov. 19.

Kegel. Determining ash or mineral content of coal etc. 31,099. Nov. 19.

Mann. 30,870. *See* I.

Maschinenbau-Austalt Humboldt. Recovery of coal from slime water. 30,144. Nov. 18. (Czecho-Slovakia, 18.3.27.)

Musker. Combustion of fuels etc. 31,087. Nov. 19.

Norgate. Washing coke etc. 30,563. Nov. 14.

Pneumatic Conveyance & Extraction, Ltd., and Smith. 30,482. *See* I.

Silica Gel Corp. Removing sulphur compounds from gas mixtures. 31,058. Nov. 18. (U.S., 19.11.26.)

Widgren and Widgren. Gas-producers. 30,588. Nov. 14. (Sweden, 22.11.26.)

Wolf. Coal-washing apparatus. 30,550. Nov. 14.

Wright. Manufacture of carbon black. 30,748. Nov. 16.

II.—Complete Specifications

26,565 (1926). Rogers. Fuel. (280,349.)

27,947 (1926). Allgem. Ges. f. Chem. Ind. Purification of hydrocarbons etc. by liquid sulphur dioxide. (268,726.)

*30,087 (1927). Sharples Specialty Co. Refining of petroleum. (280,559.)

III.—Applications

Armstrong (Plauson). Tar products. 30,988. Nov. 18.

Billinghame. Emulsification of tar etc. 30,742. Nov. 16.

IV.—Applications

Benz. Manufacturing chloropercylene quinones. 30,948. Nov. 17. (Austria, 26.11.26.)

British Alizarine Co., Ltd., and Beghin. Pyranthrone dyestuffs. 30,879. Nov. 17.

British Dyestuffs Corp., Ltd., Linch, and Rodd. Preparing triarilmethane dyes. 30,911. Nov. 17.

Carmichael (I. G. Farbenind.). Manufacture of ortho-cyanaryl thio glycolic acids. 31,066. Nov. 18.

I. G. Farbenind. Manufacture of diacidyl-derivatives of naphthalene etc. series. 31,053. Nov. 18. (Ger., 30.5.27.)

Scottish Dyes, Ltd., Barnes, Harris, and Thomas. Dyes and dyings. 30,910 and 31,151. Nov. 17 and 19.

Scottish Dyes, Ltd., Bingham, and Thomas. Production of substituted benzol habiles. 31,039. Nov. 18.

Scottish Dyes, Ltd., Fairweather, and Thomas. Production of dyestuffs etc. 31,040. Nov. 18.

Scottish Dyes, Ltd., Beckett, Thomas, and Woodcock. Production of anthraquinone derivatives. 31,152. Nov. 19.

Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. 30,551. Nov. 14. (Switz., 13.11.26.)

Manufacture of stable diazo compounds. 31,052. Nov. 18. (Switz., 18.11.26.)

IV. Complete Specifications

25,178 (1926). I. G. Farbenind. Manufacture of derivatives of benzanthrone. (259,608.)

12,126 (1927). Imray (I. G. Farbenind.). Manufacture of a greenish-yellow azo dyestuff. (280,436.)

11,052 (1927). I. G. Farbenind. Manufacture of orange vat dyestuffs of the anthraquinone series. (280,492.)

*26,447 (1927). Bohme A.-G. Production of pyridine compounds. (280,511.)

*30,551 (1927). Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. (280,595.)

V.—Applications

British Celanese, Ltd., Ellis and Olpin. Treatment of cellulose derivatives etc. 30,657. Nov. 15.

I. G. Farbenind. Treating cellulose. 30,795. Nov. 16. (Ger., 22.11.26.)

MacDowall and MacPhail. Noninflammable solvents for cleaning. 31,088. Nov. 19.

V. Complete Specifications

19,206 and 21,192 (1926). I. G. Farbenind. Protecting wool from damage by bacteria. (256,273 and 261,342.)

VI.—Applications

Auchterlone, and Franklin Processes, Ltd. Dyeing or bleaching fibres. 30,975. Nov. 18.

British Celanese, Ltd., and Ellis. Treatment of textiles. 30,658. Nov. 15.

Sassoon & Co. (Sassoon). Dyeing yarn. 30,806. Nov. 16.

Scottish Dyes, Ltd., Barnes, Harris, and Thomas. 30,940 and 31,151. *See* IV.

VI.—Complete Specifications

22,059 (1926). British Dyestuffs Corp. and Baddiley. Dyeing. (280,320.)

*5,283 (1927). Soc. des Condenseurs Delas. Dyeing, cleaning, mordanting, etc. (280,489.)

*12,822 (1927). Chem. Fabr. vorm. Sandoz. Preparation of effect threads. (280,493.)

VII.—Applications

Rivers. Manufacture of oxide of iron etc. 30,891. Nov. 17.

Silica Gel Corp. 31,058. *See* II.

VII.—Complete Specifications

19,487 (1926). Still. Manufacture of sulphur. (256,638.)

25,265 (1926). I. G. Farbenind. Production of carbon disulphide from its elements. (260,969.)

31,052 (1926). Möller and Kreith. Manufacture of readily soluble salts of hydrofluosilicic acid. (263,780.)

* 8,783 (1927). Goldschmidt. *See* XVIII.

*19,544 (1927). Suida. Recovering concentrated acetic acid from dilute acetic acid. (280,501.)

*30,040 (1927). Deuts. Gold- u. Silber-Scheidanstalt. Oxygen-evolving preparations for respiratory apparatus etc. (280,554.)

*30,339 (1927). Messer & Co. Separation of air into oxygen and nitrogen. (280,581.)

VIII.—Application

Krydel. Opacifying substance for enamels etc. 30,949. Nov. 17. (Austria, 4.1.27.)

IX.—Applications

Armstrong (Plauson). Artificial asphalt. 30,989. Nov. 18.

Lucas. Treatment of bricks etc. 31,161. Nov. 19.

Miller Bros., and Miller. Damp insulating material for buildings etc. 30,964. Nov. 18.

IX.—Complete Specifications

27,948 (1926). Wolman, Peters, and Pflug. Preservation of wood etc. (263,757.)

*30,190 (1927). Lindman. Manufacture of porous clinker-like materials. (280,567.)

X.—Applications

Asheroff. Metallurgy of ores. 31,142. Nov. 19.

Duffield. Reduction of ores. 30,718. Nov. 15.

Hagens. Metal alloys. 30,837. Nov. 16.

Picard and Sulman. Extraction of tin etc. from ores. 30,838. Nov. 16.

Smith. Extraction of zinc from ores etc. 31,139. Nov. 19.

X.—Complete Specifications

24,334 (1926). Stephan. Chlorinating roasting of burnt ore. (262,392.)

*29,176 (1927). I.-G. Farbenind. Purifying magnesium and high-percentage magnesium alloys. (280,530.)

*29,731 (1927). British Thomson-Houston Co., Ltd. Alloys. (280,537.)

*29,751 (1927). Gustafsson. Producing metals from their sulphides in electric furnaces. (280,540.)

XI.—Applications

Loke. Electric furnaces. 30,952. Nov. 17.

Marks (Stabilimenti Chimica Industriale). Manufacture of elastic dielectrical material. 30,706. Nov. 15.

Orniston. Electric battery. 31,090. Nov. 19.

Read. Selenium cells. 30,508. Nov. 14.

Russ. Induction furnaces. 30,666. Nov. 15.

Soc. Anon. Le Carbone. Accumulators. 30,710. Nov. 15. (Fr. 4.6.27.)

XI.—Complete Specification

542 (1927). Telefunken Ges., and Karolus. Photo-electric cells. (264,173.)

XII.—Applications

Baume, Boutier, and Chambige. Manufacture of emulsions etc. 30,842. Nov. 16. (Fr. 17.11.26.)

Gómez. 31,072. *See* XX.

Nobel's Explosives Co., and Scharfl. Prevention of rancidity in vegetable oil. 30,941. Nov. 17.

Welter. Manufacturing soap. 30,586. Nov. 14.

XII. Complete Specifications

12,349 (1926). Whatmough. Production of emulsions. (280,096.)

17,052 (1926). Baume, Chambige, and Boutier. Preparation of emulsions or suspensions. (255,074.)

XIII.—Applications

Kunstharzfabr. Pollak. Production of condensation products. 30,725-6. Nov. 15. (Austria, 6.4.27 and 28.6.27.)

Wright. 30,748. *See* II.

XIII.—Complete Specifications

11,286 (1927). Laporte, Alcock, and Weber. Manufacture of a white pigment. (280,435.)

*28,629-30 (1927). Bakelite Corp. Phenol resin compositions. (280,520-1.)

XIV.—Application

I.-G. Farbenind. Treatment etc. of latex. 31,025. Nov. 18.

XIV.—Complete Specifications

13,038 (1927). Rubber Latex Research Corp. Rubber compositions. (272,187.)

*30,433 (1927). I.-G. Farbenind. Preservation and treatment of latex. (280,587.)

XV.—Application

Dixon. Treatment of gelatin. 30,973. Nov. 18.

XV.—Complete Specification

*25,066 (1927). Röhm & Haas A.-G. Emulsions, particularly for tanning. (280,509.)

XVI.—Application

Rhenania-Kunheim Verem Chem. Fabr. Production of mixed manures. 30,637. Nov. 15. (Ger., 8.1.27.)

XVI. Complete Specifications

19,826 (1926) and 13,700 (1927). I. G. Farbenind. Manufacture of mixed fertiliser. (256,972 and 280,447.)

XVII.—Application

Anc. Etabl. Savy, Jeanjean, et Cie., Prescott, and Baker, Perkins, Ltd. Sugar-boiling etc. processes. 30,945. Nov. 17.

XVII.—Complete Specifications

19,820 (1926) and 10,519 (1927). Kienzle. *See* XIX.

22,544 (1926). Brier. Molasses and sugar-juices. (280,321.)

XVIII.—Complete Specifications

32,795 (1926). Hansan A.-G., and Nathan. Treatment of beer wort and beer. (280,395.)

8,783 (1927). Goldschmidt. Obtaining concentrated potassium solutions from distillers' mash. (268,790.)

XIX. Application

Schering-Kahlbaum A.-G., and Schoeller. Manufacture of mineral waters. 30,927. Nov. 17.

XIX. Complete Specifications

19,820 (1926). Kienzle. Making fodder from sugar cane. (280,284.)

20,510 (1926). British Dyestuffs Corp., Hollins, and Chapman. Manufacture of aerated waters, sparkling drinks, and the like. (280,302.)

3,702 (1927). Chem. Fabr. vorm. Schering. Diminishing or preventing loss of carbohydrates in root-crops when stored. (266,695.)

10,519 (1927). Kienzle. Manufacture of substances from sugar cane for use in the preparation of food and beverages. (280,432.)

XX. Applications

Edelman. Production of derivative of 1 methyl-3-oxy-4-isopropylbenzol. 30,819. Nov. 16.

Gómez. Esterification of fatty acids. 31,072. Nov. 18.

Holzverkohlungs-Industrie A.-G., and Fuchs. Utilising ethyl alcohol. 30,489. Nov. 14.

Schering-Kahlbaum A.-G. Manufacture of thymol etc. 30,799. Nov. 16. (Ger., 16.11.26.)

XX.—Complete Specifications

30,202 (1926). British Dyestuffs Corp., Payman, and Hall. Aromatic acid anhydrides. (280,373.)

*28,747 (1927). I.-G. Farbenind. Manufacture of organic compounds containing oxygen. (280,522.)

*29,170 (1927). Boehringer. Preparing tetrazoles. (280,529.)

*30,025 (1927). Traube and Hallriegel. Producing monoalkyl derivatives of the aminophenols. (280,553.)

*30,229 (1927). Merck, Merck, Merck, Merck, and Merck. Manufacture of aryl-amino-alkyl carbinols. (280,574.)

XXI. Applications

Halden & Co., Ltd., and Holden. Production of sensitised printing-surfaces. 30,648. Nov. 15.

Kalle & Co. Photographic processes. 30,524 Nov. 14. (Ger., 12.11.26.)

Murray and Spencer. Production of colour photographs on paper. 30,731. Nov. 15.

Soc. Indus. des Applications Chimiques, and Botson. Preparation of photographic toning-salt. 30,520. Nov. 14.

XXI.- Complete Specifications

12,161 (1926). Martinez. Colour photography. (280,053.)

12,518 (1926). Martinez. Manufacture of photo-sensitive surfaces. (280,252.)

16,585 (1926). McDougall & Yalding, Ltd., and Fryer. Insecticides, sheep dips, etc. (280,256.)

*29,011 (1927). I.-G. Farbenind. Photographic developers. (280,525.)

*30,524 (1927). Kalle & Co. Photographic processes. (280,593.)

XXIII. Complete Specification

30,040 (1927). Deuts. Gold u. Silber-Scheideanstalt. See VII.

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W., has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number: *Albania*: Galvanised sheets, iron joists and bars, templates, red copper, tin, lead, caustic soda, sodium silicate for soap making, pharmaceutical products, quinine (413). *British India*: Aniline dyes (410). *British West Indies*: Medicines, chemicals (411). *Colombia*: Air compressors (A.X.5505). *Egypt*: Steel reservoirs (A.X. 5191, 5162). *Germany*: Tubes (416); Fish, meat and bone meal (417). *Holland*: Acetone, acetic, boric, sulphuric and other acids, liquid ammonia, Peruvian balsam, glycerin, seed oils, soft soap (B.3977). *Japan*: Textile leathers (1177/27). *Latvia*: Lubricating oils, petrol (B.X. 3985). *New Zealand*: Glass bottles (B.X.4001); Transformer and switch oil (B.X. 4002); Centrifugal pump (A.X.5512); Copper wire (B.X. 4007); Bottle caps (B.X. 4008). *Norway*: Olive oil (419). *Turkey*: Zinc (A.X. 5501); Powdered graphite, manganese dioxide (B.X. 3989). *Uruguay*: Bare copper wire and cables (B.X. 4003); Twenty-two cranes (A.X. 5178). *Australia*: Steel (A. 5526 and A. 5527); *Chile*: Paper, earthenware, paints, iron, steel, metals in ingots (417). *France*: Cellulose enamels, imitation leather (431); *Germany*: Artificial silkspunners (435); *Holland*: Rubber (439). *Italy*: Vegetable oils (440). *South Africa*: Steel (A.X. 5345). *United States of America*: Soap sheets (446).

Merchandise Marks Act

Gelatin is declared by the Board of Trade, with the concurrence of the Ministry of Agriculture, not to be a food stuff for the purpose of definition under the Merchandise Marks Act, 1926.

An application received by the Board of Trade for the marking of imported size and gelatin has been referred

to the Standing Committee. Applications relating to typewriter carbons and enamel zinc sheets have also been referred to the Committee.

Safeguarding of Key Industries

The Treasury have made an Order, under Section 10 (5) of the Finance Act, 1926, exempting the following articles from Key Industry duty from November 28, 1927, to December 31, 1928: -Bromural (dormigene), eukodal, lithium carbonate, lithium hydroxide, nickel hydroxide, papaverine, R. potassium permanganate, quinine ethyl-carbonate, resorcin (resorcinol), and styracol (guaiacol cinnamate).

The Treasury Order will be published shortly.

News from Advertisements

Applications are invited for the appointment of Government Analyst and Bacteriologist, Cyprus (p. vi).

An Assistant is required in the laboratory of a water company (p. vi).

A chemical engineer is required by the builders of carbonising plant (p. vi).

Junior partnership required in a chemical concern (p. vi).

Assistant chemist wanted for paint and varnish works (p. vi).

A lady science graduate is required for general library duties, etc., etc. (p. vi).

A young graduate with experience of colour etc. manufacture is required (p. vi).

Sets of chemical journals are advertised for sale (p. vi).

Two patents are offered for negotiation (p. vi).

There are now 129 firms represented in our Buyers' Guide

PUBLICATIONS RECEIVED

L'ÉTAT COLLOÏDAL ET L'INDUSTRIE. By W. Kopiczewski. Vol. 2 of Applications Industrielles des Propriétés Colloïdales. Pp. viii + 344. Paris and Liège: Librairie Polytechnique Ch. Beranger, 1927. 70 fr.

CHEMICAL REVIEWS. Vol. IV., No. 2, September, 1927. Contributions by V. C. Vaughan, V. Henri, and J. C. Irvine. Pp. 167-229. Baltimore, U.S.A.: The Williams & Wilkins Co.; London: Baillière Tindall & Cox, 1927. 23s. 6d. post free per annum.

THE INDUSTRIAL AND ARTISTIC TECHNOLOGY OF PAINT AND VARNISH. By A. H. Sabin, M.S. Third edition, revised. Pp. xi + 459. New York: John Wiley & Sons, Inc. London: Chapman & Hall, Ltd., 1927. 25s.

BROWN'SCHE BEWEGUNG UND NICHT FLÜSSIGE DISPERSE SYSTEME. I. AEROSOLE II. FESTE DISPERSE SYSTEME. Papers read at the meeting of the Kolloid-Gesellschaft in Essen on June 10, 1927. Edited by Dr. W. Ostwald. Pp. 193-304. Dresden and Leipzig: Th. Steinkopff, 1927. 6 m.

THE JOURNAL OF THE FUEL SOCIETY OF JAPAN (NENRYO KYOKWAI SHI). Vol. VI. Ser. Nos. 52-59. January to August, 1927. Published by the Fuel Society of Japan (Nenryo Kyokwai), Saitama-Kawaguchi, Japan.

OUTLINES OF THEORETICAL CHEMISTRY. By F. H. Getman, Ph.D. Fourth edition, revised and partly rewritten. Pp. xiii + 728. New York: J. Wiley & Sons, Inc.; London: Chapman & Hall, 1927. 18s. 6d.

HANDBUCH FÜR DEN DEUTSCHEN BRAUNKOHLENBERGBAU. By G. Klein, with collaborators. Third edition. Vol. I. Part I. Die deutsche Braunkohlenindustrie. Pp. xv + 511. Halle (Saale): W. Knapp, 1927. 45 rm.

- HYDROCHLORIC ACID AND SODIUM SULFATE.** By N. A. Laury. American Chemical Society Monograph Series. Pp. 127. New York: Chemical Catalog Co., Inc., 1927. \$4.00.

EDITORIAL

Europe and U.S.A.

GR^{EAT} interest is still being taken in the possibility of a combine or strong working agreement being effected between great chemical organisations in this country, in Germany and in France and nowhere are the consequences of such a combine being more extensively discussed than in the United States. In spite of many rumours, nothing really definite has emerged, although there can be little doubt that the conversations which have been taking place for months past between leaders of the British, German and French chemical manufacturers are gradually bringing co-operation into existence. Should such develop, the trade position in respect of European chemicals will be eased and the European chemical industries will be able to present a bold front to the world and to make a strong bid for world markets. At the same time, we believe that no one need fear the creation of a monopoly here. An industry cannot survive very long in a kind of *laissez faire* somnolence induced by a supposed control of markets. There is, fortunately, no evidence that a European chemical combine would be content to rely upon an unstable monopoly or to live in the light of its past triumphs, but, quite to the contrary, it is clear that a vigorous policy of research and development would ensue. The recently announced research committee and policy of Imperial Chemical Industries, Ltd., and its past record, as well as the policy which the German I. G. pursued even when it had a virtual monopoly in the field of synthetic dyestuffs, afford us proof of this. It is, of course, clear that internecine competition and useless price-cutting would be reduced and that the closer inter-working of various factories would become possible. The conservation of capital and liquid resources and the reduction in production costs, together with the strong combined front presented towards competitors outside Europe, would considerably strengthen the European chemical industries, but it is idle to pretend that America has been singled out for attack. What many of the American newspapers have characterised as an offensive alliance against America is a natural consequence of the extremely bad European post-war economic position, and whilst it may react upon the American chemical

industry, there is no reason why a scheme for a greater unification of the European chemical industries should cause offence.

We are glad to note that responsible American opinion—and particularly that most directly concerned, that is, American chemical opinion as expressed in reputable journals—has found in the possible intensified competition from Europe a spur to greater effort. Competition is the life blood of progress, and that the American chemical industry will progress to greater triumphs we have no doubt. Advances in America will demand a progressive policy in Europe, and the world will go on from strength to strength. The challenge is a legitimate one and has been received as such, and we should like to quote from the current issue of an American contemporary in order to show that future competition will, indeed, act as a profound stimulus to effort in America and, therefore, of necessity, in Europe. It is stated that "All this (the consequences of the European combine) is a challenge to American technical brains and business ability. We have no control over the methods of organisation or trade agreements of foreign industrialists, but we know beyond a doubt the general course to pursue in meeting this new form of foreign competition. We cannot set up monopolistic organisations, but we can reduce costs through better management and elimination of waste. We cannot allocate production and markets, but we can redouble our efforts in scientific and industrial research. We cannot make price-fixing agreements, but we can pursue still further our studies in marketing methods. . . . There has been a general assumption that the European cartel movement is specially directed against American commerce. It is doubtful if this is the case."

If a solid working agreement between the European chemical manufacturers matures there will, undoubtedly, exist a "challenge to American brains," but we are confident that the American chemical industry will throw out, in due course, a challenge to European brains.

It will serve neither American nor European chemistry "to lay him down and bask him in the sun" of any monopolistic trade agreement, but challenge and counter-challenge will stimulate effort, and so with Touchstone, we shall see "how the world wags."

INDUSTRIAL FILTRATION AND FILTER AIDS

The first historical mention of filtration dates back to early in the first century A.D., and there is a great deal of interest to be read on the subject. We are only interested here, however, in the historical data in so far as they permit us to profit by experience gained in the past. This would confine us almost entirely to the subject of water filtration and sand filters, and is a subject in itself which will not be discussed here.

The first patent for a pressure filter was taken out by a Frenchman for filtering water in the first decade of the nineteenth century, but the real development in filtration and filtration apparatus seems to have taken place in the various industries proportionately to the stage of development of the process in which it is used.

We may define filtration generally as the separation of liquids from solids or solids from liquids. Such a definition is very broad and would include centrifuges, which are not generally referred to as filters and form a subject apart.

The differentiation between the separation of liquids from solids and solids from liquids may be illustrated in two extreme cases, such as the filtration of oil flotation or concentrates, wherein a relatively small percentage of water is removed from the solids by vacuum filters, and the clarification of sugar liquor such as produced from raw cane sugar, wherein a relatively small percentage of solids is removed from the liquids. In filtration various names are given to the liquid and the solids. The mixture before entering the filter is generally referred to as sludge, unfiltered liquor, dirty liquor, etc. The filtered liquid is generally called filtrate or effluent. The solids retained by the filter are generally referred to as deposit, residue, sediment, cake, etc. We will endeavour here to refer to unfiltered material, or sludge, and filtrate and cake respectively.

In order that we may have a clear understanding of what constitutes an aid to filtration, it is necessary that we review briefly what occurs in filtration and, in general, the types of apparatus used to effect filtration.

We may classify filters generally in two classes: one, those having loose filtering layers such as a sand water filter or a paper-pulp filter such as is used in the beverage industry; and, secondly, filters having woven or matted filter layers such as those which employ cloth, either woollen, cotton, or other similar materials. Metallic woven fabrics, asbestos, various fibres, and many other such materials used in the form of filter mediums come under this classification. We might make a third classification of those filters having rigid filter layers, such as are found in mechanical plants where various stone-ware and moulded porous plates are employed. There are, of course, modifications to each of these general types, but in the main two general classifications indicated may be made. Of especial interest to us is the class of filtration which employs cloth or other woven fabrics as the filter medium.

To effect filtration, of course, it is necessary that a differential exist on the two sides of the filter medium. This is accomplished in various ways. The hydrostatic head or gravity pressure of the mixture being filtered may be employed, or induced pressure by the use of various types of pumps may be used. Some of the

filters utilise atmospheric pressure by creating a vacuum on the filtrate side of the filter medium. In any case, the result is the same. The liquid is forced through the filter medium, and the solids, being too large to pass, are retained in the form of an even deposit over the surface of the filter medium. It is very rarely the case that the filter medium itself is capable of retaining all the solids during the initial period of the flow, and generally to obtain a clear filtrate it is necessary to depend upon the first layer of solids which is deposited on the woven fabric to act as the true filter medium for the remainder of the filtration period.

Certain theories can be applied and formulae evolved, and from these theories can be arrived at, but thus far it has been impossible to solve filtration problems by the use of such formulae. The rate of flow in the filter is directly proportional to the pressure applied, and inversely as the thickness of the cake. Certain constants must be arrived at, however, for inclusion in a formula derived from this theory, and in determining these constants the problem is solved in so far as concerns practical results long before the constants have been reduced to such a form that they would be applicable for inclusion in the formula.

For those who are interested in a technical and detailed discussion of this phase of the subject, the matter is discussed in an article by Sperry (*Chem. and Met. Eng.*, August 15, 1917), and another by Alliott (*J. Ind. and Chem. Eng.*, Nov., 1921). The English translation by John Joseph Eastick, of F. A. Buhler's German edition of "Filters and filter presses" is also of interest in this connexion, because it is one of the few books dealing with filters and filtration. The constants referred to depend upon such factors as viscosity and density of the liquid and the physical characteristics of the solids. The nature of the solid is generally the more important, and has direct bearing upon the result.

Solids found in filtration problems may be given two very broad classifications: First, those solids which are rigid and will not be distorted or changed in size or shape within the limits of pressure employed by filtration; and, second, non-rigid solids which include the gummy and colloidal matter which is susceptible to various physical changes in the filtration period.

It is, of course, a simple matter to visualise a high rate of flow of liquid through a cake composed of a form such as would occur in a mixture of water and sand as compared with the rate of flow which would exist where the cake formed was comprised of extremely colloidal organic matter found in domestic or industrial sewage. In the filtration of a mixture of water and sand, we have deposited on the filter cloth a layer of solids which are not distorted as the pressure increases. There would probably exist a more uniform size of channel through the cake, and channels which would be straighter and less sinuous than if the solid had been distorted and packed tightly into the interstices of the cloth and the cake itself.

Formation of the filter cake affects other results than that of rate of flow. If the solids are of a gummy and colloidal nature they enter the pores of the cloth, and even pass through into the filtrate at the beginning of the cycle and make it very difficult to clean the cloth

quickly and efficiently. If the filtrate is of value, and it is desirable to recover the filtrate remaining in the cake in the form of moisture by the use of a wash, it is desirable for the cake to be permeable, and in such condition that it will offer the minimum of resistance to the flow of the wash solution. This is especially true inasmuch as the wash water has to pass through the maximum thickness of the cake during the entire time of the washing period. Likewise it is desirable to have as permeable a cake as possible if it is desired to reduce the moisture obtained by the cake by passing air or steam through it.

It becomes apparent then that permeability of the built-up filter cake is of great importance if the greatest economy is to be obtained, and that to attain the maximum possible permeability of the cake it is necessary to have present such solids as will give maximum porosity and permeability to the cake at all times during the filtration period.

Aids to filtration, therefore, have to do with changing the physical characteristics of the solids and the liquid or introducing other solids which will change the physical characteristics of the cake. Generally, however, it will be found that the solid part of the mixture will demand more attention and will affect results more widely. Increase in temperature, of course, generally aids filtration, because of reduction of the viscosity of the liquid. The solid content of unfiltered liquids may be changed in some instances so as to produce the desired result, such as coagulation with alum in water filtration. The number of cases in which chemical treatment can be applied, however, is limited, unless some other demand proposed by the process chemically affects the result before the filtration stage is reached. Generally it is found more economical and efficient to employ the addition of a form of filter aid which when added to the mixture to be filtered becomes thoroughly intermingled with the other solids in the liquid, and finally is deposited homogeneously throughout the body of the cake.

More often than not filtration has become necessary where it is desired to effect a final clarification of the liquid. In such cases the coarser and more free filtering particles have been separated from the liquid by various roughing operations such as straining, settling, and other forms of clarification, and it is only the more finely divided and refractory solids that do not lend themselves readily to separation by any other method that we have to contend with in the final clarification.

As a typical example of such a case we may cite the filtration of sugar liquors derived during the refining of raw beet and cane sugar, glucose, syrups formed by the conversion of starch, clarification of the various vegetable oils, cereal beverages, beer, chemicals and a host of other products found in all kinds of industrial plants.

Some of the requisites of a filter aid of this kind are that it be :—

Chemically inert.

Rigid.

Porous, yet of a structure that will permit the removal to a minimum of the valuable liquids in the press cakes.

Light in weight in order that it will not settle out in filters or tanks.

Uniform in purity and structure.

Sufficiently cheap in price so that it can be employed economically.

In such form that it can be cheaply and easily applied.

A micro-analysis reveals to a great extent the adaptability of diatoms to filtration processes. An ideal combination consists almost entirely of two structures. The one a flat circular body, honeycombed, the other a thin bamboo-like spicule, but solid. These are the ideal types if found in combination and of sufficient purity.

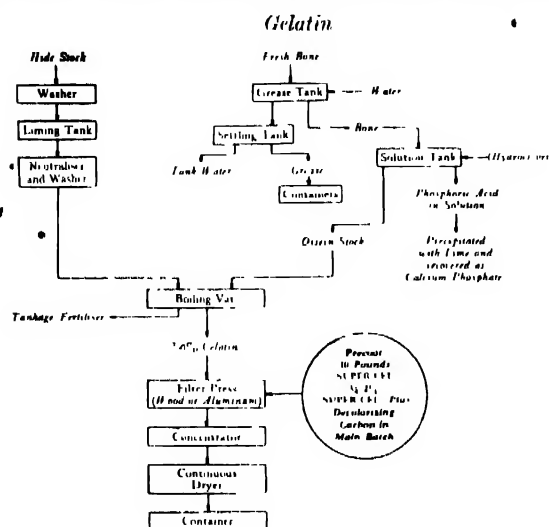

The pod-shaped hollow types, very common and generally of fresh water origin, are cored like pea pods, and have a high retention for liquids, which cannot be removed by air or steam blowing of the press cakes. They may be cheap per ton, but are very expensive in process owing to the valuable liquids which need be discarded with them. These types should be avoided.

Chemical analysis also is a factor and high silica content, above 90%, is desirable. Iron and lime content should be avoided as they are soluble and give off colours to the filtrates. Such aids are generally powdered, silicious material, and of a diatomaceous formation.

Super-Cel is a filter aid prepared from the mineral Celite which more nearly meets all of the requisites of a satisfactory filter aid than any other known material. It is very finely divided, each particle is porous and of a structure which presents the maximum permeability in the form of a filter cake, at the same time preventing even the finest suspended matter ordinarily found in filtration problems from passing through into the filtrate. It is extremely light, weighing only 6 to 8 lb. to the cubic foot loosely packed, and it is easily and simply handled. Whilst no chemical action occurs with the addition of Super-Cel in the great majority of cases, it possesses a decided energy in the presence of a great majority of gummy and colloidal substances which causes the one to be absorbed by the other. Not only, therefore, does Super-Cel intermingle inertly with the solids in the cakes, thereby increasing the permeability of the cake, but also does it decrease the number of solid particles by combining with them physically, thereby increasing the size of the cake particles, permitting greater flow through the cake and reducing the possibility of the more finely suspended matter passing through with the filtrate.

A great deal more of interest might be said on the effect of adsorption of the various liquids and solids and the changes which the filter aid effects upon the structure of the cake and the passage of the liquid and subsequently the wash solution through the cake. Each filtration problem is different in some one of its attendant factors. Changes in temperature, pressure, kinds of cloth used, the length of time for which the cloth has been in use, the kind of pump employed for inducing pressure, the manner in which the pressure is applied, the design of the filter equipment itself, all have a very vital bearing on the result, to say nothing of the fact that very seldom are the liquid and solid constituents of the mixture being filtered anywhere near the same.

Super-Cel can be applied with practically all types of filters and without changing arrangements which exist in most works. It is only necessary to add the powder in a dry form to the liquid which is to be filtered, provision being made for thoroughly agitating or mixing

in the filter aid so that it will come into intimate contact with the suspended solids.

In order that perfect clarity may be ensured from the start of the filtration cycle it is very often advisable to mix a small part of the filter aid with water or a quantity of previously filtered liquid, and charge this into the filter ahead of the main liquors to be filtered, or to charge more heavily the initial amount of liquid entering the filter in order that a deposit or skin of the finely-divided free filtering agent may be deposited immediately upon the cloth. This not only ensures retention of suspended matter from the start of the cycle, but also creates a barrier between the more gummy and colloidal substances and the cloth, thereby allowing the filter cloth to be readily cleaned without washing and as free filtering for the succeeding cycle as the one before.

The advantage of such a filter aid, therefore, resolves itself into the following:—

1. Greater clarity of the filtrate.
2. Increased rate of flow.
3. Longer filtration cycles, thereby necessitating less filters and less labour to handle a given quantity of liquids.
4. Less expense in connexion with cleaning the filter cloth.
5. Elimination of filter papers.
6. Lower pressure because of less resistance offered at the cake surface, thereby decreasing duty imposed on pumps and the filter equipment.
7. Higher clarity liquids which often reflect savings in equipment further on in the process, such as evaporators, heaters, etc., which must be periodically cleaned of deposited suspended matter.

SOME TYPICAL APPLICATIONS

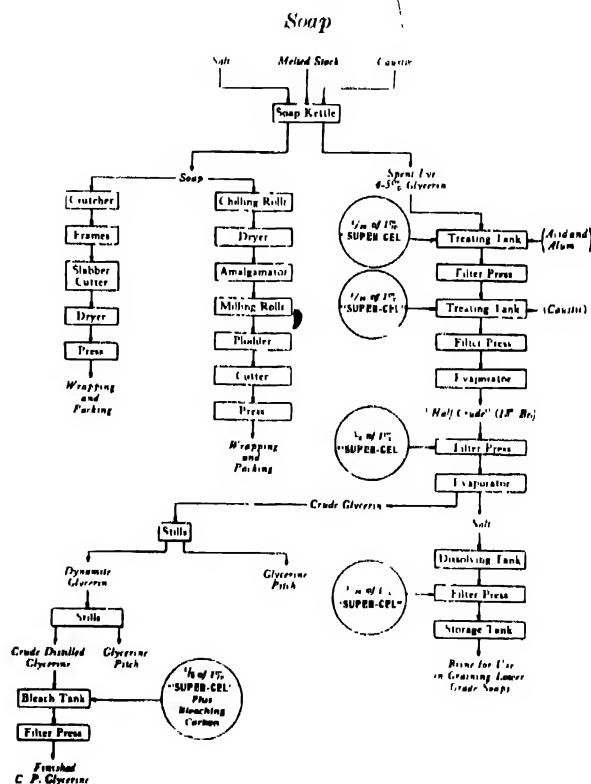

Beet sugar, juices and syrups.—Fifteen per cent. of the soluble matter entering into the raw beet juice during the

diffusion process consists of "non-sugars," or impurities, and the main problem of the beet sugar factory is the removal or elimination of these impurities from the juice.

This elimination is accomplished by changing the non-sugars from a soluble to an insoluble state, whereupon they may be separated from the sugar juice by the process of filtration.

Obviously once the impurities have been changed to the insoluble state, they should be removed from the juice thoroughly and completely, since the subsequent treatment which the juice receives oftentimes changes the solids back to the soluble condition with resulting increase in sugar loss. Two other important operations are influenced by the presence of cloudy matter in the juice—evaporation and boiling. Cloudy juice sent to the evaporators will cause undue scale formation within the tubes. Cloudy syrup in the boiling pans will decrease the yield of crystallised sugar.

Before the invention of the filter-press, the best liquors were clarified by decantation, and then filtered through large cylindrical tanks filled with bone-char. These

methods have long been abandoned, and now filter-presses and leaf type filters are in general use. The diagram on the following page illustrates the use of a filter aid in the manufacture of beet sugar.

Varnish.—Recent developments have changed entirely the position which filter presses formerly held in the clarification of varnish. For some years they have occupied a "middle" position. They were recognised as more efficient than the settling process. Yet, while giving better clarity, the filter press was handicapped

by its relatively low capacity and higher operating costs when compared with the centrifuge.

Now the costly items of filter press operation have been reduced, the use of Super-Cel instead of filter papers at a third their cost, enables rates of flow from 2 to 8 times

10—15 lb. Super-Cel per 100 sq. ft. filter area and 0.25% (on the weight of liquor) in the main batch, was found to be $4\frac{1}{2}$ gals. per sq. ft. per hour.

Many other illustrations of the uses of filter aids could be given as in the preparation of soap, sulphur dyes, azo dyes, intermediates, and so on. Of interest, too, are the flow-sheets given on p. 1146, which indicate the various steps in the manufacture of gelatin and of soap.

In these flow sheets the precoat is given in pounds of Super-Cel per 100 sq. ft. of filter area, whilst the amount used in the main batch is given on the weight of liquor to be filtered.

A great deal more can be written on the subject, as filters and filter aids find application in practically every modern plant.

CARBONISATION IN VERTICAL RETORTS*

By T. CAMPBELL FINLAYSON, M.Sc., A.M.I.Chem.E.†

The success attained by the various systems of carbonisation in continuous vertical retorts is one of the outstanding features in gas engineering during the past two decades. Twenty years ago continuous carbonisation was in the experimental stage. to-day it is computed that over 50% of the coal carbonised in British gasworks is treated in continuous vertical retorts. For there to have been such a general acceptance of new methods of carbonisation in a comparatively short period, vertical retorts must hold some very big attractions to gas engineers. One of the objects of this paper is to examine closely these advantages.

The success attained in the construction of continuous vertical retorts is attributable to the careful development of certain main features:—(1) The development of suitable devices for coke extraction. (2) The design of top ironwork through which the coal enters the retort. (3) Correct taper of the retort. (4) The method of heating the retort. (5) The construction of the retort.

The advantages which can be claimed for the process of carbonisation in continuous vertical retorts may be summarised as follows:—

A. Large output of gas per square foot of ground space.—In these days of increasing demand for gas, the problem of producing the maximum output from a given ground space is becoming a matter of increasingly great importance. Of all the forms of carbonising plant, continuous vertical retorts give the largest output of gas per sq. ft. of ground space occupied, and in this direction striking developments have been made within the past few years as illustrated in the attached table.

(Ground space occupied by four typical installations of W-D continuous vertical plant)

Installation	Year	Capacity tons per 24 hrs.	Ground space occupied sq. ft.	Sq. ft. ground space per ton carbonised per 24 hrs.	Cb. ft. gas* (500 B.Th.U.) per sq. ft. ground space per 24 hrs.
A	1914	120	4970	41.4	377
B	1919	200	8230	41.2	378
C	1925	512	13,420	26.2	595
D	1927	695	14,232	20.5	761

* Based on an average yield of 15,000 cb. ft. per ton

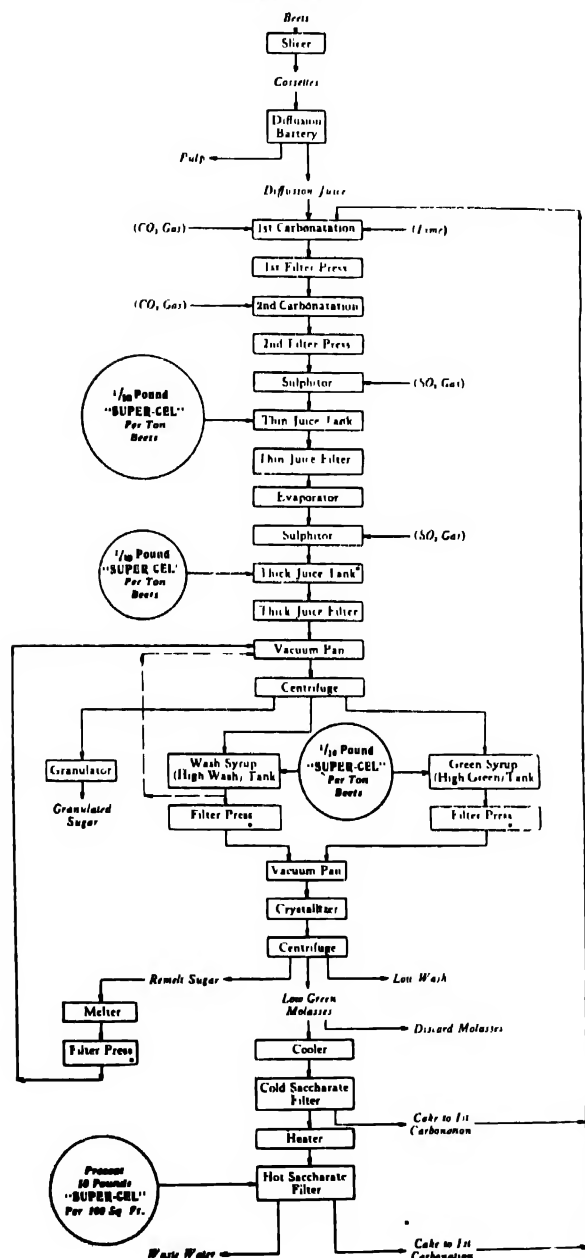

In comparison with the old hand-charged stop-end horizontal retorts of twenty years ago, the modern

* High green—high wash—remelt and thick juice generally filtered in common battery of interchangeable filters.

as rapid and gives perfect clarity. The filter aid is added either in the set pot or kettle and the material is run directly to the filter to save heat, though, if desired, the filter aid can be added in a mixing tank. The rate of flow, with one medium gum varnish, using a precoat of

vertical retort installation can produce approximately eight times as much gas per sq. ft. of ground space and approximately three times the amount of modern machine-charged horizontal retorts.

B. High thermal yield per ton of coal. At present gas is sold on the basis of calorific value. This has increased the tendency to supply a mixture of coal-gas and water-gas for town's purposes. In the continuous vertical retort, mixed coal-gas and water-gas can be made in one apparatus by introducing steam at the base of the retort, whereby a two-fold object is served. The red-hot coke passing down to the bottom of the retort is cooled and the steam usefully employs the sensible heat of the coke in the production of water-gas.

C. Flexibility.—Continuous vertical retorts are flexible as regards the calorific value of the gas and output. The calorific value can be altered by variation in the percentage of steaming, and the output by the simple operation of altering extractor speed.

D. Heat Conservation.—The modern continuous vertical retort installation is highly efficient from the thermal point of view. The factors which have led to this state of affairs are:—(1) Design of step grate producers (2) silica construction of the retorts; (3) installation of waste heat boilers; (4) heat insulation of settings, flues and boilers.

In the modern type of continuous vertical retort setting, as much as 1500 lb. of steam per ton of coal carbonised can be obtained. In assessing the thermal value of a process of carbonisation, it is the net amount of fuel consumed, or in other words the heat supplied to the producer less the heat value of the steam recovered, which is important: 1500 lb. of recovered steam is equivalent to at least 188 lb. of dry coke. With modern installations the net fuel consumption is not more than 7%.

E. Satisfactory operating conditions.—From the point of view of those operating the plant, continuous vertical retorts give more favourable conditions than any other form of carbonising plant. Heavy work is reduced to a minimum, and by suitable use of heat insulating material the double object is achieved of improved operating conditions and effecting heat conservation.

F. Low capital cost.—Although there have been many developments in design and improvements in the output per square foot of ground space, the factor which is probably the most striking and has the greatest influence at the present time is the fact that capital cost is low. The present-day installation costs no more than the old fireclay type of settings erected 12 years ago.

A recent development of interest in connexion with continuous vertical retorts is that blue water-gas can successfully and economically be made by charging them with graded coke. In brief, the process consists of charging the retort with graded coke in place of coal, and extracting unconsumed coke at the bottom to the extent of approximately 2 lb. per 1-in. retort major axis per hour. Saturated steam is introduced through the normal steaming jets in the curved plate of the extractor box to the extent of 3 lb. per 1-in. retort major axis per hour. The retort is operated under normal heating

conditions and at level gauge at the gas offtake. Under these conditions, good quality blue water-gas is produced to the extent of about 75 cb. ft. per 1-in. retort major axis per hour. The composition of the water-gas remains very constant, containing on an average 4% CO₂ and 44% CO, with a calorific value of 290 to 300 B.Th.U. Operation of retorts for a period on water-gas production has the advantage that the scurf in the retort is removed by the interaction between the steam and the scurf.

The subject of carbonisation in vertical retorts would be incomplete without some attention being given to vertical retorts on the intermittent as well as the continuous principle. Carbonisation in intermittent vertical chambers has for many years been a system very popular on the Continent, although it has not yet been widely adopted in this country. In comparison with other forms of static carbonisation, intermittent vertical chambers have the advantage that an increased output can be obtained per sq. ft. of ground space; in addition, a larger gas yield per ton of coal carbonised can be obtained than from either horizontal retorts, inclined retorts or coke ovens, due to the steaming of the charge during the last few hours of the carbonisation period. The chambers are economical to operate, in that once having elevated the coal to the overhead bunkers, the charging and discharging of the chambers both take advantage of the laws of gravity. These chambers have the advantage that they can carbonise any class of coal or slack, and the plant has many attractions in a number of instances. The continuous and static forms of carbonisation in vertical retorts are not necessarily competitive. In one large installation at present being erected for the Glasgow Corporation Gas Department, the plant is to comprise a combination of W-D continuous vertical retorts and W-D intermittent vertical chambers, the combination being such as to give with the particular coals which are to be carbonised, and the particular calorific value which is to be made, the best all-round results. In brief, the position is that, in general, Scotch coals are of relatively low caking quality. This, whilst making them particularly suitable for giving maximum throughputs and relatively high thermal yields when treated in continuous vertical retorts, yet has the disadvantage that the small material tends to remain in the form of breeze after carbonisation. In this new scheme at Glasgow, the continuous vertical retorts are operated under steaming conditions, treating the coal above $\frac{3}{4}$ in. The coal below $\frac{3}{4}$ in., after washing and drying, will be blended with caking slacks, and the mixture treated in the intermittent vertical chambers operated to make high calorific value gas and high-quality coke. This arrangement will give flexibility as regards selection of coals and calorific value, and secure the production of high-quality coke.

CANADIAN INDUSTRIAL NOTE

The British Empire Steel Corporation announces it has sold the entire output of the Bell Island Iron Mines, Newfoundland, for the year 1928. The total quantity to be mined is 1,300,000 tons, of which 800,000 tons will go to Germany, 100,000 tons to the United States, and 400,000 tons to the Corporation's own works at Sydney, N.S.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

BINDING CASES FOR BRITISH CHEMICAL ABSTRACTS AND JOINT INDEX

Abstracts "B" and Index to "A" and "B"

Binding cases for the above publications, in dark blue cloth, will be available, commencing with the 1927 issues.

The price will be 3s. 9d. per set of two cases, postage 6d. extra, or, separately, 2s., postage 3d. extra.

Abstracts "A" and Index to "A" and "B"

Cases are also available in Maroon or blue cloth, price 3s. 9d. per set of two cases, postage 6d. extra.

Orders, accompanied with remittance, should be forwarded to Messrs. Gurney & Jackson, 33, Paternoster Row, London, E.C.4.

LONDON SECTION

At the meeting, held on December 5, a paper, entitled "The automatic analysis of liquids and its application to control of water softening plants," was read by Dr. H. S. Hatfield. A summary of the paper follows.

Liquids, such as ordinary hard water, boiler water, wash waters, and other liquors in industry, are automatically titrated with suitable reagents in an apparatus which takes a measured sample of the liquid, delivers it into a reaction vessel, and gradually adds reagent until an end point is reached, when the reaction vessel is emptied automatically, and a fresh sample of liquid delivered to it. The amount of reagent added each time is recorded on a chart. The end point for hard water, which is titrated with standard soap solution, is given by the formation of froth, air being blown through the liquid in the reaction vessel. The vessel is pivoted so as to be overweighted by its contents, and the weight of the froth overflowing from it is used to trip a catch and allow it to empty itself. It then returns to its original position, and in doing so trips a catch which causes the measuring vessel, full of a fresh sample, to empty its contents into the reaction vessel. With other titrations, such as acid-alkali, the end point is given by the cessation of current delivered to a relay from an electrode in the reaction vessel separated by a porous partition from another electrode in a buffer solution representing the end point.

Further mechanism was described, by which the indications of such automatic titrators are caused to control the valve by which reagents, such as softening chemical, are delivered to the main bulk of the liquid, a sample of which is being titrated. Another form of apparatus is of a hit-or-miss type, in which a single measured bulk of reagent is added to a measured bulk of liquid, and a signal is given to denote whether the reagent is sufficient to effect full reaction or not. Such an apparatus is used to give a signal when a water supply exceeds a certain degree of hardness.

OTTAWA SECTION

The regular meeting held on November 17 was preceded by dinner at the University Club: there was a very good attendance, in spite of the inclement weather.

The first paper was by Mr. John Macoun, and bore the title, "The determination of alcohol in solutions containing acetone." Experiments carried out in the laboratory of the Department of National Revenue resulted in a method for quantitatively eliminating acetone and closely related ketones from solutions of ethyl and methyl alcohols. The errors involved are larger than is desirable, but less than in any other methods yet suggested. Until a better method is found, it is permissible to use this one for fiscal purposes. As the errors always tend to show an alcoholic content lower than that actually present, the method is never a source of injustice to the tax-payer. The method consists of a condensation with benzaldehyde in the presence of potassium hydroxide, when, if acetone is the ketone, dibenzylidene acetone is formed. It is not applicable at present to mixtures of both alcohols with acetone.

An outline of the manufacture and application of vitreous enamels was given by Mr. W. Mayor. Enamel frit is not made by the firms engaged in enamelling processes, but is the special care of supply houses. Frit usually is a complex alkaline borosilicate containing fluorine, though individual formulae vary and are kept secret. The metal to be enamelled is carefully cleaned, and the enamel mixture made from the frit is sprayed on, or the piece is dipped. The pieces are dried and the enamel is burnt on in electric or oil-fired muffles. As, after cleaning, the ware is pickled, a rough surface is left, on which the enamel fuses during the burning, and to which it adheres when cold. Colours are obtained by mixing metallic oxides with the enamel mixture.

CALENDAR OF FORTHCOMING EVENTS

Dec. 9.—**Society of Dyers and Colourists, Manchester Section.** Jointly with the Manchester Section of the Institution of the Rubber Industry (cf. *CHEM. AND IND.*, December 2, p. 1122.).

Dec. 9.—**Institute of Metals, Sheffield Local Section.** The University, St. George's Square, Sheffield, at 7.30 p.m. "Stresses in non-ferrous castings," by Prof. C. H. Desch.

Dec. 9.—**Institution of Engineering Inspection.** "Low-temperature distillation of coal," by F. R. Wade and C. H. Parker.

Dec. 9.—**Biochemical Society.** Imperial College of Science and Technology, Royal School of Mines, Prince Consort Road, South Kensington, S.W.7, at 4.45 p.m. (cf. *CHEM. AND IND.*, December 2, p. 1122.).

Dec. 12.—**Institute of Chemistry, Manchester Section.** Address by the Chairman, Mr. L. Guy Radcliffe, followed by a dinner and dance.

Dec. 12.—**Institute of Metals, Scottish Local Section,** 39, Elmbank Crescent, Glasgow, at 7.30 p.m. "Age hardening of alloys," by R. Hay.

Dec. 12.—**Ceramic Society.** North Staffordshire Technical College, Stoke-on-Trent, at 7.30 p.m. "Combustion of carbonic oxide," by Prof. W. A. Bone.

Dec. 13.—**Royal Colonial Institute.** Luncheon at the Cannon Street Hotel, E.C.4. Address by Sir John Russell.

Dec. 13.—Institution of Petroleum Technologists. *General Meeting.* House of the Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m. *Symposium on "Detonation in motor fuels,"* opened by H. R. Ricardo.

Dec. 13.—Hull Chemical and Engineering Society, Hull Photographic Society's Rooms, Grey Street, Hull, at 7.45 p.m. "Steel—its structure and tempering," by C. C. Hall.

Dec. 13.—Institution of Mechanical Engineers. Meeting at Swansea. "Reduction of steel works costs by the use of waste-heat boilers," by J. Adamson and F. Jones.

Dec. 13.—Royal Institution of Great Britain, 21, Albemarle Street, W.1, at 5.15 p.m. "A year's work in X-ray crystal analysis," by Sir W. Bragg.

Dec. 13.—Royal Photographic Society, Scientific and Technical Group, 35, Russell Square, W.C.1, at 7 p.m. (1) "Chemical effects of radiations," by M. P. Villard. (2) "Change of focus when the object possesses great depth," by H. W. Lee. (3) "Rate of desilveration of the wet collodion silver bath," by P. P. O'Shaughnessy.

Dec. 13.—Society of Chemical Industry, South Wales Section, The Technical College, Cardiff, at 7.30 p.m. "Notes on coal research," by Dr. S. R. Illingworth.

Dec. 14.—Royal Society of Arts, John Street, Adelphi, W.C.2, at 8 p.m. (*Ordinary Meeting.*) "The evolution of modern road surfaces," by Major R. G. H. Clements.

Dec. 14.—Society of Glass Technology, University College, Gower Street, W.C.1, at 2.40 p.m. (1) "Analysis of opal glasses," by J. H. Davidson and Miss V. Dumbleby. (2) "Durability of iron-containing glasses," by Miss V. Dumbleby and Prof. W. E. S. Turner. (3) "Effect of iron oxide on the properties of glass," by S. English, H. W. Howes, and Prof. W. E. S. Turner.

Dec. 14 to 16.—Institute of Chemistry. Jubilee Celebrations. (Cf. 1151 of this issue.)

Dec. 15.—Chemical Society, Burlington House, Piccadilly, W.1, at 8 p.m. *This Ordinary Scientific Meeting has been abandoned.*

Dec. 15.—Institute of Metals. *Birmingham Local Section.* Engineer's Club, Waterloo Street, Birmingham, at 7 p.m. "Duralumin," by L. Aitchison. (*Arranged by the Co-ordinating Committee.*)

Dec. 15.—Royal Institution of Great Britain, 21, Albemarle Street, W.1, at 5.15 p.m. "Petroleum natural gases and their derivatives," by J. Kewley.

Dec. 15.—Society of Dyers and Colourists, West Riding Section. Leeds University. "Leather dyeing," by H. Salt.

Dec. 15.—Society of Dyers and Colourists, Midlands Section. Leicester Technical College, at 7.30 p.m. "Hydrogen peroxide bleaching," by I. E. Weber.

Dec. 16.—Society of Chemical Industry, Liverpool Section. Joint meeting with the Chemical Engineering Group. The University, Liverpool, at 6 p.m. "Oil pollution of seas and harbours and a remedy," by C. S. Garland.

Dec. 16.—Manchester Literary and Philosophical Society, Chemical Section, at 7 p.m.

Dec. 21.—Ramsay Chemical Dinner, held under the joint auspices of Society of Chemical Industry, Institute of Chemistry, Society of Dyers and Colourists, Glasgow University Alchemists' Club, Andersonian Chemical Society, Ardeer Chemical Club, and the Royal Philosophical Society of Glasgow, in the Trades House, Glassford Street, Glasgow, at 6 for 6.30 p.m. This year the Dinner has been subtitled "The Institute of Chemistry Jubilee," and the Chairman will be Prof. A. Smithells.

CHEMICAL SOCIETY

Fifty-three new Fellows were elected at a meeting held on December 1, the President, Prof. H. Brereton Baker, C.B.E., F.R.S., occupying the Chair. Fellows were reminded that the meeting arranged for December 15 has been abandoned, and that remittances (5s. 6d.) for the Annual Reports, 1927, will be received (from Fellows only) up to Christmas Day. Fellows of the Chemical Society can now obtain the *Chemisch Weekblad* and the *Recueil des travaux chimiques* at reduced rates on application to Dr. A. D. Donk, Verspronckweg 100, Haarlem, Holland.

Mr. H. Paget read the following paper :—

Action of Beckmann's chromic acid mixture on some monocyclic terpenes. [With T. A. Henry.]

As a preliminary to work already published (J., 1925, 127, 1649), the action of chromic acid, under similar conditions, on α -terpinene, *l*-limonene and α -phellandrene was examined. α -Terpinene is known to be oxidised mainly to dimethylacetylacetone, only traces of $\alpha\delta$ -dihydroxy- α -methyl- δ -isopropyladipic acid being formed (J., 1921, 119, 1714; 1923, 123, 1878). *l*-Limonene is converted into 1 : 2 : 8-trioxyterpan and a keto-lactone, $C_{10}H_{16}O_3$, both of which have already been obtained by Wallach by the oxidation of terpineol, so that the latter appears to be the first product of the action of chromic acid on limonene.

α -Phellandrene is oxidised to two keto-lactones, $C_{10}H_{16}O_3$, and $C_9H_{14}O_3$, for which constitutional formulae are suggested, isopropylsuccinic acid, thymoquinol, and thymoquinone; the disemicarbazone of the latter has been obtained for the first time in two stable yellow modifications and one colourless labile form.

Dr. J. L. Simonsen remarked on the difficulty of identifying monocyclic terpenes, and on the advantage of using chromic acid as a reagent in this field of work.

Dr. F. L. Pyman described the following two investigations :—

The condensation of glyoxalines with formaldehyde. [With R. Grindley.]

A study of the condensation with formaldehyde of several derivatives of glyoxaline containing various substituents shows :—(1) that glyoxalines containing a free imino-group yield 4(5)-hydroxymethyl derivatives, (2) that N-methylglyoxalines yield either 2- or 5-hydroxymethyl derivatives, (3) that no condensation products of nitroglyoxalines with formaldehyde could be isolated.

Glyoxaline-4(5)-formaldehyde. [With W. Hubball.]

METHYLATION of glyoxaline-4(5)-formaldehyde, its 5(4)-methyl-homologue and methyl glyoxaline-4(5)-carboxylate shows that the carbonyl group behaves like the nitro-group in directing the formation predominantly of substances in which the carbonyl and methyl groups are in the 5 : 1-position.

Dr. O. L. Brady asked whether the authors had considered the configuration of glyoxalineformaldoxime;

α -oximes seem characteristic of the benzene ring and β -oximes of aliphatic aldehydes.

Prof. C. S. Gibson inquired whether catalysts had been employed in the condensation of glyoxaline with formaldehyde, and whether any abnormality or resin-formation had been observed. Crystalline products, for example, are obtained when certain catalysts are used in condensing *m*-cresol with formaldehyde.

Dr. Pymon replied that the configuration of the oxime had not been investigated. Catalysts had not been employed; the reaction was effected at 125–135° in a sealed tube with 40% formaldehyde, the yields being usually 40–50% of the theoretical. Much resin was also produced.

Prof. T. M. Lowry discussed :—

Studies of dynamic isomerism. Part XXVI. Consecutive changes in the mutarotation of galactose. [With G. F. Smith.]

(a) THE mutarotation of galactose does not conform even approximately to the unimolecular law, since the velocity-coefficient for a solution of α -galactose in water at 20° decreases from $k_e = 0.0256$ at 7 min. to a limiting value $k_e = 0.0192$ as the rotation approaches the equilibrium value $[\alpha]_{5461} = 94^\circ$. On the other hand, the velocity-coefficient for β -galactose increases from zero to the same limiting value. Since the form of the curve is the same for solutions containing 2.5, 5, 10, and 15% of α -galactose, these anomalies are attributed to consecutive unimolecular reactions.

(b) The initial stage of mutarotation of α -galactose can be interpreted as a unimolecular change, proceeding with a velocity coefficient 0.064 between the limits $[\alpha]_{5461} = 169^\circ$ to 135° . The initial change of β galactose is not accompanied by any alteration of rotation; mutarotation is therefore due to further changes undergone by an initial product of similar rotatory power to the β -sugar, namely $[\alpha]_{5461} = 63^\circ$. The mutarotation curve is inflected, the inflexion having an "intercept-ratio" 0.09, which approximates closely to the theoretical maximum value 0.0939 of this ratio.

(c) These observations show that the intermediate form or forms through which α - and β -galactose are converted into one another in aqueous solution play an important part in mutarotation, and persist as major constituents in the final equilibrium.

Dr. O. L. Brady discussed :

Triazole compounds. Part II. Methylation of some 1-hydroxy-1 : 2 : 3-benzotriazoles. [With C. V. Reynolds.]

THE methylation of 1-hydroxy-1 : 2 : 3-benzotriazole and of 1-hydroxy-6-methyl-1 : 2 : 3-benzotriazole gives a larger proportion of N- to O-methyl derivative than does the methylation of the more strongly acidic nitro-hydroxy-benzotriazoles previously studied (J., 1923, 123, 2258). It seems that the alkylation of these compounds is analogous to that of the oximes (J., 1926, 2394), and that the O-methyl derivative is formed by an ionic and the N-methyl derivative by a molecular reaction.

The constitution of the N-methyl derivative is established as follows :

Prof. D. R. Boyd discussed :

The reaction between diaryloxyisopropyl alcohols and phosphorus oxychloride in the presence of pyridine. [With D. E. Ladhams.]

WHEN di-*p*-toloxyisopropyl alcohol reacts at 0° with excess of phosphorus oxychloride in the presence of pyridine, the product obtained, on treating the reaction mixture with ice, is chiefly di-*p*-toloxyisopropyl phosphate ($C_6H_7 \cdot O \cdot (CH_2)_2 \cdot CH \cdot O \cdot PO(OH)_2$), but if the reaction mixture is heated at 100° before decomposing with ice, di-*p*-toloxyisopropyl chloride is formed, together with a comparatively small amount of the corresponding pyridinium salt, $C_5H_5N \cdot CH((CH_2)_2 \cdot O \cdot C_6H_7)_2 \cdot Cl$. Similar results have been obtained with other diaryloxyisopropyl alcohols. Pyridine forms with phosphorus oxychloride a crystalline additive compound $(C_5H_5N)_2 \cdot POCl_3$. An explanation of these observations is offered.

INSTITUTE OF CHEMISTRY

JUBILEE CELEBRATION, DECEMBER 14–15, 1927

The arrangements for the Jubilee Celebration of the Institute are well in hand. The occasion will afford an exceptional opportunity for the reunion of old friends from all parts of the country. Representatives of many professional and scientific societies and institutions, and of the Local Sections of the Institute, will be present. The members of the Committee of the London and South Eastern Counties Section will act as stewards. Over 1250 guests are expected at the *Conversazione* to be held at the Wharnccliffe Rooms on the evening of Wednesday, December 14. Members of the Institute and of allied chemical societies and institutions who have accepted the invitation extended to them by the President and Council and who have received tickets are asked to note that the President and Mrs. Smithells and the Council of the Institute will receive them from 7.30 p.m.

Over 1000 tickets have been issued for seeing the films illustrating British industries, which will be shown by the courtesy of the Federation of British Industries and the Gaumont Company at the New Gallery Cinema, 123, Regent Street, on Thursday, December 15, from 10.30 a.m. to 12.30 p.m. Ticket holders will be admitted from 10 a.m. and are advised to be in their places in good time.

A large and distinguished company is expected at the Jubilee Dinner, which is to be held at the Wharnccliffe

Rooms on Thursday, December 15, at 7 for 7.30 p.m. Guests are advised to arrive in good time.

Sir Alfred Mond will propose the toast of the evening.

On Wednesday, December 14, and Thursday, December 15, at the Institute's headquarters, 30, Russell Square, documents and portraits of historical interest, particularly in connexion with the foundation of the Institute, will be exhibited. In addition, Mr. George H. Gabb has kindly promised to lend a number of very interesting documents and apparatus relating to Joseph Priestley, Mr. Cecil H. Cribb has kindly promised to lend a selection of prints and other exhibits of interest to chemists, and the Institute's collection of lantern slides, illustrating the history of chemistry, will be displayed.

On Thursday, the 15th, the Master and Wardens of the Worshipful Company of Salters, in honour of the occasion, will entertain to luncheon, at Salters' Hall, the President, Officers and Council of the Institute and the representatives of many societies and institutions.

CORRESPONDENCE THE HISTORY OF SUGAR

SIR.—Referring to your Editorial on Sugar in the current number of CHEMISTRY AND INDUSTRY, there are several references in the Old Testament to "sweet cane" or "sweet calamus," which, used as an ingredient for anointing oil, might be an article of merchandise coming from afar; on the other hand, it may have been the root-stock of the sweet fig (*Acorus calamus*). Mr. Fairrie, in his valuable book "Sugar," quotes the following lines, in reference to sugar cane, from the Atharva Veda

"I have surrounded thee with a clinging sugar cane,
so thou shalt not be averse to me"

I think we owe our first European knowledge of sugar to the peregrinations of Alexander the Great. At any rate Nearchus, an Admiral of the famous tyrant, found a "kind of honey growing in canes or reeds," in the East Indies about 325 B.C. It was in use in the Greek and Roman Empires, but only as medicine probably owing to its prohibitive price. Dioscorides, a physician, calls it "sugar," but "Indian salt" seems the more common term. "Zucra" has come down to us from one Albertus Agnensis, a monkish writer of the twelfth century, who calls it the product of "sweet honeyed reeds" which Crusaders used to suck in Tripoli.

It was planted by the Moors in Spain soon after 716 A.D. who no doubt got it from Egypt, and it seems likely that the latter country gave it in abundance to Greece (via Syria and Rhodes) and Sicily (via Tunis and Malta).

As one who is very interested in sugar, I hope some of your readers will be able to offer some information on the subject.—Yours, etc.,

J. BADGER-CLARK

PERSONAL AND OTHER ITEMS

At the anniversary meeting of the Royal Society, on November 30, the following medals were presented by the President, Sir Ernest Rutherford:—The Copley Medal to Sir Charles Sherrington, a Royal Medal to

Sir Thomas Lewis, and the Buchanan Medal to Dr. Greenwood. A Royal Medal had been awarded to Prof. J. C. McLennan, the Hughes Medal to Dr. W. D. Coolidge, and the Davy Medal to Prof. A. A. Noyes, but they were unable to be present.

The following sectional presidents (*inter alios*) have been appointed for the meeting of the British Association in Glasgow next year from September 5-12, under the presidency of Sir William Bragg:—Section A (Mathematical and Physical Sciences), Prof. A. W. Porter; Section B (Chemistry), Prof. E. C. C. Baly; Section I (Physiology), Prof. C. Lovatt Evans; Section L (Education), Prof. A. Smithells.

Lord Stanmore and Messrs. J. T. Phelan and H. S. Sugden, representing the Ship Canal Portland Cement Manufacturers, have been elected to the board of the Holborough Cement Company.

Messrs. W. L. H. Roberts, R. M. Cook, and A. Clarke Vincent have resigned from the board of the Holborough Cement Company.

The death is announced of Dr. Milton Whitney, the agricultural chemist, who had been head of the U.S. Bureau of Soils from 1891 until a few months ago.

The family of M. Solvay has given 25 million francs (about £143,000) to the Belgian National Fund for Scientific Research.

Oil Pollution

An important meeting will be held jointly by the Chemical Engineering Group and the Liverpool Section of the Society of Chemical Industry on Friday, December 16, 1927, for which an attractive programme has been arranged. In the afternoon a visit will be paid to the s.s. *Adda*, a Diesel-engined vessel; afternoon tea will subsequently be served in the Chemistry Department Library of the University; and at 6 p.m. the joint meeting will be held in the Electricity Lecture Theatre of the University, when Mr. C. S. Garland, B.Sc., A.R.C.S., F.I.C., M.I.Chem.E., a former chairman of the Chemical Engineering Group, will deliver a paper on "Oil pollution of seas and harbours—and a remedy." The paper will be illustrated by lantern slides and a cinematograph film of a prolonged test carried out by H.M. Admiralty.

Chemical Society

The Library of the Chemical Society will be closed for the Christmas holidays at 1 p.m. on Friday, December 23, and will re-open at 10 a.m. on Thursday, December 29. The meeting arranged for December 15 will not be held.

British Photographic Research Association

The report of this Association for the year 1926-27 announces that the Department of Scientific and Industrial Research has offered the Association a block grant for the five years ending May 31, 1932, which, added to a minimum amount guaranteed by the Association, would make the income £5000 per annum. A new condition was imposed requiring the appointment of a governing Committee of five technical and scientific persons, appointed partly by the Association and partly by the Department, to supervise the scientific investigations of the Association. We are glad to learn that, with the acceptance

of this offer, the valuable work which the Association has been doing will be continued. The important investigations on silver halides, the fundamental studies of photographic sensitivity, especially in relation to gelatin and other important problems, are being carried on, and co-operation between the technical members of the firms and the Association is steadily increasing. A large number of papers and confidential reports was published by the staff of the Association during the year and the valuable work which it has accomplished in the past promises well for the future.

Cast Iron Research Association

At the annual general meeting, held on November 30, Mr. H. B. Weeks, chairman of the Council, who presided said that the long protracted coal dispute proved a serious handicap. General difficulties were responsible for several withdrawals from membership particularly among small foundries. That was particularly unfortunate in view of the hopes entertained of a fuller response from the industry following the highly satisfactory report made by the committee of the Department of Scientific and Industrial Research at the end of the first five years' working of the Association. The Association, like others of its type, had always been handicapped by the fact that it had no capital. It worked entirely from income, which it was expected to expend in its legitimate activities. Only a limited amount of money, therefore, saved from income, was available for capital expenditure. Out of some 2000 foundries throughout the country, the subscribing membership of the Association in all classes was only 299, of which 226 were ordinary and trade members. Over £40,000 had been spent by the Association in research work during its six years of existence.

Major-Gen. Sir Philip A. M. Nash was elected president of the Association for the coming year in succession to Sir John Dewrance. Mr. T. Donaldson, Mr. A. W. Steven, Mr. W. Reavell, and Mr. W. Turner McLellan were elected vice-presidents, and Sir William Bird and Mr. T. V. Miles were re-elected as vice-presidents.

First International Conference on Light and Heat in Medicine

The First International Conference on Light and Heat in Medicine, Surgery and Hygiene will be held at the Central Hall, Westminster S.W. 1, from December 13 to 16, inclusive. On December 15, the chair will be taken by Prof. E. C. Baly, C.B.E., F.R.S., and the following papers will be given: (1) "Ultra-Violet in sunlight and artificial light sources," by L. Hill, M.B., F.R.S. (2) "Vitamin D and its relation to the irradiation of foodstuffs," by Prof. I. M. Heilbron, Ph.D., D.Sc. (3) "Can the chemist and physicist be of use in actinotherapy?" by F. H. Humphries, M.D., D.M.R.E.

In connexion with the Conference, an International Exhibition in the Central Hall will be opened by Sir Alfred Mond at 2.30 p.m. on December 13, and will remain open until December 19, from 2.30 to 9 p.m. each day.

Molybdenum Development in Canada

Of interest for the manufacturers of special steels is the announcement that arrangements are being made for the development of the large deposit of molybdenite at Lake Malartic, near Amos, Quebec.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
Acid Boric, Commercial.—Cryst., £30 per ton; Powder, £32 per ton; Extra fine Powder, £34 per ton.
Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
Copper Sulphate.—£25—£25 10s. per ton.
Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
Nickel Sulphate.—£38 per ton d/d.
Nickel Ammon. Sulphate.—£38 per ton d/d.
Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d. £18 per ton, according to strength. 20s. less for contracts.
Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crinson.—1s. 4d.—1s. 6d. per lb., according to quality.
Arsenic Sulphide, Yellow.—1s. 9d. per lb.
Barytes.—£3 10s.—£6 15s. per ton, according to quality.
Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
Carbon Bisulphide.—£20—£25 per ton, according to quantity.
Carbon Black.—5½d. per lb., ex wharf.
Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
Chromium Oxide, Green.—1s. 1d. per lb.
Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £10 5s. per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32" Tw.; 1s. per gal. 24" Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha. Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead. £40 15s. per ton.

TAR PRODUCTS

Acid Carbohc. Crystals.—7½d.—8d. per lb. Crude 60's. 2s. 4d. 2s. 5d. per gal.
 Acid Cresylic, 90/100. 2s. 11d.—3s. per gal. 97/99. 2s. 4d.—2s. 8d. per gal. Pale, 95%o, 2s. 3d.—2s. 6d. per gal. Dark, 95%o, 2s. 1d.—2s. 3d. per gal.
 Anthracene Paste. A quality, 2½d. per unit, 40%o, £5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9¾d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d. 1s. 6d. per gal., ex works in tank wagons.
 Toluene.—90%o, 1s. 4d. 1s. 8d. per gal. Pure, 1s. 6d. 2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.
 Creosote.—Cresylic 20/24%o.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d. 7¾d. per gal. ex works. Salty, 7d. per gal., less 1%o.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10d. per gal. Solvent 95/160, 1s. 3d.—1s. 4d. per gal. Solvent 90/190, 8½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £13—£13 10s. per ton. Flaked, £14—£15 per ton.
 Pitch, medium soft.—85s.—90s. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 9d.—6s. 6d. per gal. 90/180—3s. 6d.—5s. per gal. Heavy.—3s.—3s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—4s. 6d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—8d. per lb., naked at works.
 Aniline Salts.—8d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb., 100%o.
 Benzaldehyde.—2s. 3d. per lb.

* Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—5½d. per lb.
 m-Cresol 98/100%o.—2s. 3d.—2s. 5d. per lb.
 p-Cresol 32/34° C.—2s. 3d.—2s. 5d. per lb.
 Dichloraniline. 1s. 10d. per lb.
 Dimethylaniline.—1s. 11d. per lb.
 Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—10d. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb.
 β-Naphthylamine. 3s. per lb.
 o-Nitraniline.—5s. 9d. per lb.
 m-Nitraniline.—3s. per lb. d/d.
 p-Nitraniline.—1s. 8d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb.
 R. Salt.—2s. 2d. per lb.
 Sodium Naphthionate.—1s. 8½d. per lb. 100%o basis d/d.
 o-Toluidine.—8½d. per lb.
 p-Toluidine.—2s. per lb., ex works, naked.
 m-Xyldine Acetate.—2s. 6d. per lb. 100%o.
 N.W. Acid.—4s. 9d. per lb. 100%o.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%o.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 3½d. 2s. 5d. per lb.
 Acid, Benzoic B.P. 2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—Cryst. 36s.—39s. per cwt. Powder 40s.—43s. per cwt.; Extra Fine Powder, 42s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 6¾d.—1s. 7d. per lb. Less 5%o.
 Acid, Gallic. 2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst. 7s. 3d. per lb. Resublimed.—8s. 3d. per lb.
 Acid, Salicyche.—B.P. pulv. 1s. 2½d. 1s. 4½d. per lb. Technical 11½d.—11¾d. per lb.
 Acid, Tannic, B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%o.
 Acetanilide.—1s. 6d. 1s. 9d. per lb. for quantity.
 Amidol.—7s. 6d.—9s. per lb. d/d.
 Amidopyrim. 8s. 6d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 5d. per lb., according to quantity.
 Ammon. Carbonate B.P. Lump £37 per ton. Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—9s. per oz.
 Barbitone.—5s. 9d.—6s. per lb.
 Benzonaphthol. 3s. 3d. per lb.
 Bismuth Carbonate.—10s. 4d.—10s. 7d. per lb. Bismuth Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—9s. 10s.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb. Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Subchloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.—8s. 1d.—8s. 4d. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi et Ammon. Cit. B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—Crystal 25s. per cwt. Powder 26s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.
 Bromides.—Ammonium.—2s. 3d. per lb. Potassium.—

1s. 10 $\frac{1}{2}$ d. per lb. Sodium.—2s. 1d. per lb. Granulated $\frac{1}{2}$ d. per lb. less. All spot. Large quantities at lower rates.
 Calcium Lactate B.P.—1s. 2d.—1s. 3 $\frac{1}{2}$ d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.
 Chloroform.—2s. 3d.—2s. 7 $\frac{1}{2}$ d. per lb., according to quantity.
 Creosote Carbonate.—6s. per lb.
 Ethers: S.G. 730, 10 $\frac{1}{2}$ d.—1s. 1 $\frac{1}{2}$ d. drums. Other gravities at proportionate prices.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiaccol Carbonate.—4s. 9d.—5s. per lb.
 Hexamine.—2s. 3d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal.; 20 vols., 3s. 4d. per gal.
 Hydroquinone.—3s. 3d.—3s. 6d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—18s.—20s. per cwt., according to quantity.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2 $\frac{1}{2}$ %; Heavy Commercial £21 per ton, less 2 $\frac{1}{2}$ %; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol—A.B.R. recryst., B.P., 17s. 3d. per lb. net. Synthetic detached crystals, 8s. 6d.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig. 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb.
 Special prices for larger quantities.
 Methyl Salicylate.—1s. 9d. per lb.
 Methyl Sulphonal.—8s. 9d.—9s. per lb.
 Metol.—9s.—11s. 6d. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 4d. per lb. Less in quantity.
 Phenacetin.—2s. 6d.—2s. 9d. per lb.
 Phenazone.—4s.—4s. 3d. per lb.
 Phenolphthalein.—6s. 6d.—6s. 9d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 96s. per cwt., less 2 $\frac{1}{2}$ %.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—6 $\frac{1}{2}$ d. per lb. spot.
 Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.
 Resorcin.—3s. 9d.—4s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.
 Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7d.—1s. 9d. per lb. Crystal, 1s. 8d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.
 Sulphonal.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 2d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Aubepine (*ex Anethole*).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 3d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 6d. per lb. Geraniol (Palmarosa).—17s. 9d. per lb. Geraniol.—6s.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. per lb. Linalol.—(*ex Bois de Rose*) 14s. per lb.—(*ex Shui Oil*) 9s. 9d. per lb. Linalyl Acetate.—(*ex Bois de Rose*) 17s. 6d. per lb.—(*ex Shui Oil*) 13s. 9d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Norolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—31s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpineol.—1s. 8d. per lb. Vanillin.—15s. 3d.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb.
 Bergamot.—26s. per lb. Bourbon Geranium.—13s. per lb.
 Camphor.—9d. per lb. Cananga, Java, 15s. 9d. per lb.
 Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 9d. per lb., c.i.f. U.K. port, for shipment over 1928. Ceylon, Pure, 1s. 7d. per lb. Clove, pure 6s. per lb.
 Eucalyptus, Australian.—2s. 1d. per lb. Lavender.—Mont Blanc, 28/40%, 17s. per lb. Lemon.—8s. 6d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. 3d. per lb. Peppermint.—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST.

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Jan. 30th, 1928. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Dec. 15th, 1927. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Baudini. Quick-drying process for plastic masses. 31,413. Nov. 22.

Bentham, and Simon, Ltd. Extraction of solid materials from air. 31,249, 31,250. Nov. 21.

- Brécat. Purifying gases etc. 31,682. Nov. 24.
 Outlack. 31,564. *See* XVIII.
 Eppenbach. Homogenising-mill. 31,420. Nov. 22. (U.S. 19,727.)
 • Gram, Söderlund, Testrup, and Techno-Chemical Laboratories. Drying-apparatus. 31,253. Nov. 21.
 • Levêque. Heat-exchangers. 31,327. Nov. 22. (Belg. 26,11,26.)
 Marks (Lister et (ie.). Manufacture of emulsions etc. 31,908. Nov. 26.
 Mond (Metallbank und Metallurgische Ges.). Treating gases etc. 31,421. Nov. 22.
 Pilat. Adsorption processes etc. 31,396. Nov. 22.
 • Studienges. für Gasindustrie. Adsorption and drying of gases. 31,555. Nov. 23. (Ger., 23,11,26.)
 Weir, Ltd., and Son. Evaporators. 31,314. Nov. 22.

I.—Complete Specifications

- 13,029 (1926). I.-G. Farbenind. Manufacture of aqueous emulsions and suspensions of substances insoluble in water. (252,392.)
 20,287 (1926). General Electric Co., Ltd., and Bell. Furnaces. (280,634.)
 20,850 (1926). Billwiler. Prevention and removal of incrustation in boilers. (257,915.)
 22,681 (1926). Riley, and Scott & Son (London), Ltd. Tubular evaporators. (280,666.)
 29,960 (1926). Fairweather (Selden Co.). Regeneration of catalysts. (280,712.)
 1511 (1927). Benson and Denholm. Rotary cylinder drying-apparatus. (280,740.)
 12,021 (1927). Petersen. Filter for fine filtration of liquids (280,802.)
 *30,491 (1927). Loewe. Obtaining a very high vacuum. (280,908.)
 *30,842 (1927). Baume, Chambige, and Boutier. Manufacture of emulsions or suspensions. (280,930.)
 *30,956 (1927). Silica Gel Corp. Manufacture of catalytic gels. (280,939.)
 *31,058 (1927). Silica Gel Corp. *See* VII.
 *30,918 (1927). Silica Gel Corp. Impregnated gel for adsorbing water vapour. (280,934.)

II.—Applications

- Clancy. Manufacture of low-boiling oils etc. 31,228. Nov. 21.
 Coley. Manufacture of gas. 31,636. Nov. 24.
 Friedlaender & Co. Briquetting etc. non-caking fuels. 31,910. Nov. 26. (Ger., 27,11,26.)
 Ges. für Linde's Eismaschinen. 31,290. *See* VII.
 Hansen. Manufacture of liquid hydrocarbons. 31,913. Nov. 26.
 Humphreys and Glasgow, Ltd. Apparatus for making carburetted water-gas. 31,280. Nov. 21. (U.S., 10,12,26.)
 Mueller. Regenerative coke ovens. 31,628. Nov. 24.

III.—Complete Specifications

- 19,860 (1926). Continentale A.-G. I. Chemie. Fuel for internal-combustion engines. (267,079.)
 20,380 (1926). I.-G. Farbenind. Manufacture of hydrocarbons or derivatives from carbonaceous materials. (257,912.)
 22,903 (1926). Rolfsen. Manufacture of lubricants. (258,606.)
 30,125 (1926). Chem. Werke Carbon. Manufacture of highly-active carbon blocks or granules. (266,674.)
 31,593 (1926). Stratford. Evaporating oils. (280,727.)
 731 (1927). Internat. Bergen-Gie. voor Olie- en Kolen-chemie, and Debo. Hydrogenation and cracking of hydrocarbon compounds. (280,734.)
 5296 (1927). Urbain. Simultaneously producing a gas of the nature of water-gas, phosphoric acid, and an aluminium silicate slag. (280,763.)

*28,748 (1927). I.-G. Farbenind. Recovering acetylene from gaseous mixtures. (280,885.)

*30,588 (1927). Widegren and Widegren. Gas-producers. (280,912.)

III.—Application

I.-G. Farbenind. Production of aromatic hydrocarbons. 31,501. Nov. 23. (Ger., 24,11,26.)

IV.—Applications

- Carpmael (I.-G. Farbenind.). Manufacture of copper ammine complex azo compounds. 31,230. Nov. 21. Manufacture of hydrogenated aromatic amino compounds. 31,394. Nov. 22.
 I.-G. Farbenind. Manufacture of phenylthioglycolic acids etc. 31,393. Nov. 22. (Ger., 24,11,26.)
 Imray (I.-G. Farbenind.). Manufacture of nitro 2:3-dichloro 1:4-naphthoquinone. 31,369. Nov. 22.
 Johnson (I.-G. Farbenind.). Production of vat dyestuffs 31,218. Nov. 21.
 Scottish Dyes, Ltd., Beckett, Thomas, and Woodcock. Manufacture of amino-halogen-anthraquinones 31,254. Nov. 21.

IV.—Complete Specifications

- 20,316 (1926). Carpmael (I.-G. Farbenind.). Manufacture of dyestuffs of the anthracene series. (280,637.)
 20,511 (1926). British Dyestuffs Corp., and Hailwood. Manufacture of a solubilised vat-dye and process of dyeing therewith. (280,647.)
 20,857 (1926) and 16,731 (1927). British Dyestuffs Corp., Shepherdson, and Thornley. Manufacture of black and grey vat-dyes. (280,652.)
 21,065 (1926). I.-G. Farbenind. Manufacture of vat-dyestuffs. (257,618.)
 *9471 (1927). I.-G. Farbenind. Manufacture of vat dyestuffs. (280,846.)
 *28,062 (1927). Silesia. Verein Chem. Fabr. Separation of mono- and dialkyl derivatives of aromatic amines. (280,877.)
 *28,749 (1927). I.-G. Farbenind. Manufacture of vat dyestuffs. (280,886.)
 *31,052 (1927). Soc. Chem. Ind. in Basle. Manufacture of stable diazo-compounds. (280,945.)

V.—Applications

- Rohm. Chlorination of hair, wool, etc. 31,678. Nov. 24. (Austria, 1,12,26.)
 Imperial Chemical Industries, Ltd., and Savage. Treating greasy fibrous materials. 31,431. Nov. 23.
 Lohfeld. Treatment of artificial fibrous material. 31,292. Nov. 21.
 Morden. Manufacture of cellulose acetate. 31,786. Nov. 25.
 Scutan Co. Proofed paper. 31,704. Nov. 21. (U.S., 26,11,26.)
 Vles. Preparing partially hydrolysed cellulose acetates etc. 31,828. Nov. 25.

V.—Complete Specifications

- 15,291 (1926). Sajitz, Sajitz, and Pospiech. Spinning of viscose solutions. (280,608.)
 20,205 (1926). Carpmael (I.-G. Farbenind.). Manufacture of artificial silk. (280,628.)
 20,235 (1926). Nanji. Manufacturing pulp for paper. (280,629.)
 27,709 (1926). Schulz. Spinning of artificial threads according to the stretch-spinning process. (261,365.)
 14,667 (1927). Hagglund. Treatment of the black liquor obtained in the manufacture of wood fibre by the soda process. (273,267.)
 19,424 (1927). I.-G. Farbenind. Opening-up materials containing cellulose. (274,892.)

21,442 (1927). I.-G. Farbenind. Opening-up materials containing cellulose. (276,025.)

*30,795 (1927). I.-G. Farbenind. Treating cellulose. (280,922.)

VI.—Applications

British Celanese, Ltd. Treatment of materials consisting of cellulose derivatives. 31,485. Nov. 23. (U.S., 30.12.26.)
Dyeing textile fibres etc. 31,486. Nov. 23. (U.S., 11.12.26.)

Morton. Manufacture of colour-printed fabrics. 31,309. Nov. 22.

Waddell and Watson. Treating yarn etc. with liquids. 31,719. Nov. 25.

VI.—Complete Specifications

20,511 (1926). British Dyestuffs Corp., and Hailwood. *See* IV.
27,216 (1926). British Celanese, Ltd., and Ellis. Mordanting and colouring materials made of or containing cellulose derivatives. (280,698.)

26,706 (1927). I.-G. Farbenind. Treatment of fibres or fibrous materials with aqueous liquids. (278,752.)

VII.—Applications

Ges. für Linde's Eismaschinen. Extracting ammonia from gases. 31,290. Nov. 21. (Ger., 27.11.26.)

Norsk Hydro Elektrisk Kvaestofakt. Concentration of dilute nitric acid. 31,529. Nov. 23. (Norway, 6.12.26.)

VII.—Complete Specifications

31,051 (1926). Moller and Kreth. Preparation of solutions of hydrofluosilicic acid. (263,779.)

5296 (1927). Urban. *See* II.

5610 (1927). Lederer, Stanczak, and Kassler. Obtaining metal hydroxides free from iron. (267,491.)

10,039 (1927). I.-G. Farbenind. Recovery of sulphur from solutions of ammonium polysulphides. (269,546.)

17,628 (1927). Titan Co. Akt. *See* X.

18,850 (1927). Deutsche Gold- u. Silber-Scheideanstalt. Production of alkali hydride. (276,313.)

*31,058 (1927). Silica Gel Corp. Removing sulphur compounds from gas mixtures. (280,917.)

VIII.—Complete Specifications

*29,297 (1927). Vollkommer. Melting of enamels, frits, and glazes. (280,895.)

*30,428 (1927). Dents. Gasglühlicht Auer-Ges. Manufacture of articles of highly refractory material. (280,907.)

IX.—Applications

Hinton. Making cementitious material. 31,608. Nov. 24.
Lanes. Manufacture of bituminous macadam etc. 31,825. Nov. 25.

Longley and Watson. Cements etc. 31,618. Nov. 24.
Artificial stone etc. 31,619. Nov. 24.

Schenkel. Manufacture of artificial stone. 31,817. Nov. 25. (Ger., 19.2.27.)

IX.—Complete Specifications

5296 (1927). Urban. *See* II.

14,901 (1927). Doughty. Producing coloured cement. (280,813.)

X.—Applications

Internat. Nickel Co. Manufacture of carbon-free metals. 31,557. Nov. 24. (U.S., 19.5.27.)

Krupp Grusonwerk A.-G. Treatment of sulphide ores. 31,664. Nov. 24.

Lindhorst. Hardening iron etc. 31,242. Nov. 21.

Metropolitan-Vickers Electrical Co., Ltd., Baron, and Phillips. Production of aluminium silicon alloys. 31,707. Nov. 24.

Royen. Production of pure iron. 31,898—9. Nov. 26. (Ger., 14 and 15.12.26.)

X.—Complete Specifications

20,208 (1926). Western Electric Co. Magnetic materials. (273,628.)

20,250 (1926). Liban. Applying zinc coatings to iron articles. (257,262.)

20,677 (1926). Western Electric Co., Inc. Magnetic materials. (274,136.)

XII.—Complete Specification

*30,842 (1927). Baume, Chambige, and Bontier. *See* I.

XIII.—Applications

British Celanese, Ltd. Manufacture of thermo-plastic materials. 31,487. Nov. 23. (U.S., 29.12.26.)

Carpmael (I.-G. Farbenind.). Manufacture of synthetic resins. 31,395. Nov. 22.

I.-G. Farbenind. Preparing surfaces for reception of cellulose lacquers. 31,655. Nov. 24. (Ger., 24.11.26.)

XIV.—Complete Specifications

20,332 (1926). Potts (Koepp & Co.). Coagulation of rubber latex. (280,639.)

21,767 (1926). British Dyestuffs Corp., Cronshaw, and Naughton. Manufacture of vulcanised rubber. (280,661.)

XV.—Application

Alcan. Tanning-materials. 31,432. Nov. 23. (Belg., 23.11.26.)

XVI.—Applications

Johnson (I.-G. Farbenind.). Obtaining crystals in fertiliser salts. 31,639. Nov. 24.

Liljenroth. Producing fertilisers etc. 31,402. Nov. 22. (Sweden, 12.7.27.)

XVII.—Complete Specification

16,095 (1927). Elektro-Osmose A.-G. Purifying sugar solution. (272,943.)

XVIII.—Application

Cutlack. Sterilising pulp for filtration of beer etc. 31,564. Nov. 24.

XVIII.—Complete Specifications

*22,504 (1927). Claassen. Manufacture of baking-yeast. (280,861.)

XIX.—Applications

Barrett, Barrett, Crepin, and Felstead. Extraction of preservatives from liquid food. 31,895. Nov. 26.

Johnson (I.-G. Farbenind.). Production of vitamin D. 31,219. Nov. 21.

Kjaergaard. Manufacture of feeding-cakes. 31,527. Nov. 23.

Whatmough. Manufacture of fruit preserves etc. 31,792. Nov. 25.

XIX.—Complete Specifications

12,708 (1926). Bartmann. Treatment of cereals. (280,605.)

8930 (1927). Posternak and Posternak. Separating and purifying the three phosphorus-containing bodies derived from the proteids contained in egg yolk. (268,806.)

*22,504 (1927). Claassen. See XVIII.

XX.—Applications

Arnold (Standard Oil Development Co.). Manufacture of esters. 31,246. Nov. 21.

Carpmael (I.-G. Farbenind.). Manufacture of ortho-aminophenylmercaptans. 31,540. Nov. 23.

Klapproth. Purification of lactic acid. 31,342. Nov. 22. (Ger., 22,11,26.)

Schering-Kahlbaum A.-G. Manufacture of thymol. 31,231. Nov. 21. (Ger., 22,11,26.)

Selden Co. Catalytic oxidation of organic compounds. 31,605. Nov. 24. (U.S. 24,11,26.)

XX.—Complete Specifications

17,156 (1926). Newbery, and May & Baker, Ltd. Manufacture of organic compounds of arsenic. (280,613.)

27,014 (1926). I.-G. Farbenind. Manufacture of alkaline esters of *n*-substituted ortho-aminobenzoic acid. (260,605.)

10,085 (1927). Rubber Service Laboratories Co. Manufacture of acetaldehyde and of acetaldehyde-amine condensation products. (269,556.)

*30,799 (1927). Schering-Kahlbaum A.-G. Manufacture of thymol, its isomers or homologues, and their hydrogenation products. (280,924.)

*31,231 (1927). Schering-Kahlbaum A.-G. Manufacture of thymol or its isomers and their homologues, and their hydrogenation products. (280,956.)

*31,342 (1927). Klapproth. Purification of lactic acid. (280,969.)

XXI.—Complete Specifications

11,980 (1927). I.-G. Farbenind. Manufacture of photographic plates or films. (275,933.)

*27,509 (1927). I.-G. Farbenind. Photographic developer. (280,873.)

XXII.—Applications

Matter. Explosives. 31,819. Nov. 25. Manufacture of heavy metal azides. 31,820. Nov. 25.

XXIII.—Application

Buckle. Treatment of water containing materials in suspension. 31,621. Nov. 24.

XXII.—Complete Specifications

21,935 (1926). Scheidt. Sterilising liquids by means of ultra-violet rays. (257,956.)

24,731 (1926). California Fruit Growers Exchange. Insecticides and fungicides. (267,878.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*British India*: Artificial silk yarn (451); Steel (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Colombia*: Zinc roofing (A.X. 5554). *Germany*: Shellac (458). *Hungary*: Artificial silk yarn (461). *Lithuania*: Bronze wire (A.X. 5552). *South Africa*: Steel plate tanks (A.X. 5565); Structural steelwork (A.X. 5566); Anti-friction grease (B.X. 4020). *United Kingdom*: Indian gum tragacanth (Indian Trade Commissioner, 42, Grosvenor Gardens, London, S.W.1, Ref. I.T.C., 51261).

Solvents and Plasticisers in the Cellulose Lacquer Industry

Messrs. W. J. Bush & Co., Ltd., and the Methylating Co., Ltd., announce that they have merged their interests in the manufacture of solvents and plasticisers used in the cellulose lacquer industry.

Safeguarding of Key Industries

There will be a hearing on Tuesday, January 17, of the complaint which the Board of Trade has received under Section 1 (5) of the Safeguarding of Industries Act, 1921, that calcium biphosphate (baking powder quality) has been improperly excluded from the list H ii. of articles chargeable with duty under Part I of that Act, as amended by Section 10 of the Finance Act, 1926. The hearing will take place at 11 a.m. in the Main Conference Room, Board of Trade, Great George Street, London, S.W.1, and the tribunal will consist of Mr. A. A. Hudson, K.C., the Referee, and Prof. F. G. Donnan, C.B.E., F.R.S., and Prof. J. F. Thorpe, C.B.E., F.R.S., who have been selected by the Lord Chancellor for the purpose of this arbitration from the panel constituted under Section 10 (4) of the Act of 1926.

News from Advertisements

The Sir John Cass Technical Institute invites applications for the post of lecturer in inorganic and physical chemistry (p. vi).

Applications are invited from mechanical draughtsmen (p. vi).

A chemist is required for confectionery works (p. vi).

Various sets of the JOURNAL etc. are required (p. vi).

There are now 129 firms represented in our Buyers' Guide.

EDITORIAL

More About Research

WE are very grateful to Professor Thorpe for the information contained in the letter we publish in this week's JOURNAL, and are glad to explain more fully what we really meant by our recent editorial. Our statement was, substantially, that most of the research conducted by students was valuable as a training for them, but of no great value to others, and that, subject to this, we had the highest opinion of the research carried on by the Universities. Having now learned that students do not, as we supposed, conduct research, we must withdraw any qualification, and we are now enabled to express our highest opinion of the research carried on by the Universities. Our opinion, which must be valuable, otherwise no one would take the trouble to correct it, is based on the great advance which chemistry has made during many years, an advance in which this country has been prominent, and on the admirable papers published in the proper journals. Our loose way of using the words "research" and "conduct" is responsible for our ambiguity, and it was aggravated by our ignorance, which we mentioned. If we had stated that students assisted in research, probably we should have escaped the pit into which we fell and from which Professor Thorpe rescues us. We have a vague recollection of hearing of "research students", probably as incorrect as many of our other recollections; also we think we have met with comparatively young chemists who have told us of the research they did in the days when they were still in *statu pupillaris*. We attach no importance to these statements. If we were a few, say twenty, years younger and a happy student at some University, how we should enjoy being allowed to conduct a piece of research? It would teach us a great deal; but now our brain is not so receptive as it was; we have given hostages to fortune and cannot spare the time to widen our experience in this way. We are not yet vain enough to think that our research would have been of any value, except to ourselves. Professor Thorpe tells us that students work at problems which are part

of a general scheme of research. We feel sure that the Universities do not do the main thinking, leaving the student merely to carry out a set of specified experiments: this would, no doubt, facilitate the research, but would relieve the student of too much responsibility. From the point of training the more responsibility the student has had at the University, the better fitted he will be to undertake research in the works laboratory. In all probability Professor Thorpe's facts and opinions do not differ from our own; the main difference is that he knows the facts fully, and we do not, and that we use the word "research" in that vague sense current among manufacturers, and he uses it in the precise sense prevailing in academic circles.

The Government and Research

We have been gently chided also for writing that the Government was lavish in its expenditure on research. This opens up a difficult question, exposes it to criticism, as it were; and it would require several columns, more than we can spare this side of Christmas, to sketch even lightly our views on this topic. The Army, the Navy, and the Air Force are becoming more and more dependent upon chemistry and chemical research. In this country, as in America, chemistry is called in to protect the Inland Revenue Department, that none who dwell beneath the spangled banner shall rob the Customs of a single tanner! Chemical research is essential to the Board of Trade and the Office of Works, and if our great coal problem, a political problem of the first importance, is solved, it will be by the chemist, the chemical engineer and the man of business, not by the politician. Such requirements cause the Government to spend considerable sums on research, and it seems to us that this money is usually wisely and economically spent. On the other hand, we have come across instances where the Government has been in the habit of spending a sovereign when to us, with no exact knowledge, it seemed that it only got five shilling's worth of value. This is what we call lavish expenditure. The prosperity of the nation, the worldly hope men set their hearts

upon, demands in these times a hard-hearted man who is quite prepared to spend money on research until captive science yield her last retreat, but grudges a waste of money even in the pursuit of so laudable an object. It is hard to lay down general rules—one man's waste is another man's income, as the proverb has it; it is still harder to give specific instances, that let no man expect. there are times in the history of governments, as there have been times in the history of companies and societies, when economy is of the greatest importance. But who can think of economy at Christmas time! Perish the thought! When we write our prose ode on the departing year, let us choose a more exhilarating key, something that fits the clarion or trombone; we have had enough of the dying notes of the oft-complaining flute.

The Ionoclast

There is a small and select body of men which is determined on a number of reforms in chemical thought and chemical verbiage. One special reform is the use of the word "ion," on those few occasions when its use is justified at all, in the sense used by Faraday seventy or eighty years ago. To this small but not silent band many of the modern conceptions of physical chemistry are vague and misleading phantasmagoria: there is an old chemistry, the chemistry of Dalton, Lavoisier, Frankland, and Hofmann, a chemistry to which the atom was nearly sufficient and in which the word "ion" played a very small part. This chemistry seems to be the only chemistry which those who detest the ion and the ionic nomenclature consider as of much value: they are out to put the ionists and the ion in their proper place, which we suppose to be the gutter. These ionoclasts are hardy and bold and quite unaccustomed to fear: they include Prof. H. E. Armstrong, Calorier, Struwpeter Redivivus, and a few other chemists who write in these columns and in other columns to which they have access. As a rule, their unanimity is admirable: they hardly ever contradict each other, and this, the only present, school of philosophers, like the old Cynics or Epicureans, has its own traditional language, favourite authors and peculiarities. Of this school Prof. H. E. Armstrong is the founder, and he has impressed himself so strongly on his followers that their literary effusions are often mistaken for his own. We are not clear whether Sir Ernest Rutherford, Prof. Lowry, and the other writers who are now put in the pillory will mend their ways or not; for their own peace of mind and the advancement of knowledge it is to be hoped that they will, perhaps they are old enough and determined enough to fend for themselves, whether this is so or not, we feel that the chief ionoclast will persist with his efforts until chemists and physicists adopt the meaning of the word "ion" acceptable to him. The Archbishop of York recently stated, amid laughter, "It requires a man in full vigour to do anything quite so strenuous as to retire. When that time is past, a man generally drifts into the position of having only one desire, and that is to prove to people that he can do things which everyone knows he cannot." One of Prof. Armstrong's followers gives us a good dressing down this week for the ambiguity of the language

of lawyers and, in particular, our humble selves. This is one of the few occasions when there is a lack of harmony between two members of the school, for the professor has often deplored to us that chemists were not as precise in their language as lawyers. We recollect a sentence or two of Hobbes in which he speaks of the absurdities to be found in the books of philosophers. "And the reason is manifest. For there is not one of them that begins his ratiocination from the definitions or explications of the names they are to use: which is a method that hath been used only in geometry, whose conclusions have thereby been made indisputable." Also, "metaphors, and senseless and ambiguous words, are like ignes fatui: and reasoning upon them, is wandering amongst innumerable absurdities; and their end, contention, and sedition, or contempt." We quote these words with approbation, for we prefer precise words ourselves.

We are satisfied that, as a body, lawyers are as precise in their use of words as scientific men, and the banter of Struwpeter on this matter does not disturb us in the least. In all matters of the use and meaning of words, of grammar, of arrangement of words, and such attempts at style as are suitable for an editor, we have only one standard. It is a standard to which, of course, we do not always attain: it is better to have an ideal that is a little loftier than one's practice. Our standard is the usage of those writers who, in present times, are careful of their writing, and may be considered as masters in their art: so far as scientific terms are concerned, the only standard we recognise is the modern usage of scientific men. We admit that we have a few fads of our own: we do not object to a few fads, probably our own fads verge on pedantry: this is immaterial. In a living language like English, each writer will choose his own class of those whose works are to form a standard. Struwpeter refers us to a dictionary for a definition of the word "theory": we do not know who wrote this passage nor when: it does not matter to those who think as we do, if those scientific men who are careful in their writing, who write easily and gracefully, use the word theory only in the sense Mr. S. quotes, then we think we ought to do the same. We merely quoted Lyell and Faraday and Darwin as writers belonging to the type we have in mind. We could quote in addition Sir Edward Thorpe, Prof. Aston, Prof. Dale the astronomer, Profs. Dawson, Briscoe, Whiddington and Robinson, and probably a good many more. Mr. S. - or is it Prof. S! - wishes us to write in "immutable" words: we recall a passage written about two hundred and thirty years ago by a very learned man: "Every living language, like the perspiring bodies of living creatures, is in perpetual motion and alteration: some words go off, and become obsolete: others are taken in, and by degrees grow into common use; or the same word is inverted to a new sense and notion, which in tract of time makes as observable a change in the air and features of a language, as age makes in the lines and mien of a face." The exact meaning to be attributed to the word ion, to the word theory, and to other words, depends on the employment of these words by a numerous body of men, and we think that the ionoclasts can do very little to affect the result. We trust, with some degree of confidence, that this will not deter them.

OIL POLLUTION OF SEAS AND HARBOURS—AND A REMEDY*

By C. S. GARLAND, B.Sc., A.R.C.S., F.I.C., M.I.Chem.E.

That so much of the advance of civilisation during the past thirty years depends upon the application of oil as a source of motive power is of special interest to this country, which, with its island position and having practically no natural sources of petroleum, depends upon supplies of oil carried to its shores. This absence of natural sources of oil and the long experience of steam engines deriving their power from coal-fired boilers, accounts for the comparative slowness with which British shipping, extremely jealous of its high reputation for reliability, has adopted oil as a source of power for marine propulsion, either for the raising of steam under boilers or in internal combustion engines. The advantages of oil fuel in respect of the weight and size of machinery, the convenience of handling and stowing, as well as in increased speed, are, however, now generally recognised. The rapidity with which the world's shipping is being converted to oil burning is shown by the increased tonnage of oil-burning vessels, the total for 1926 being more than fourteen times that for 1914

	Oil fuel steamers	Motor ships	Total
1914	1,306,000	245,000	1,551,000
1919	5,300,000	752,000	6,052,000
1926	18,200,000	3,190,000	21,390,000

Of the total tonnage at present building in this country 35.5% is oil-driven, the corresponding percentage for the more important Continental shipyards being 55.5%. Although experiments are being made in the use of powdered coal for ship propulsion, and in the application of higher steam pressures from coal-fired boilers, it appears almost certain that within the next fifteen or twenty years practically the whole of the world's shipping will depend upon oil as the source of power.

Few such revolutionary advances have been made which have not carried with them some compensating disadvantage, and without question one of the greatest objections to the extended use of oil in this way is the pollution of the seas to which it has given rise. There are three principal sources of pollution:

A. Discharge of oil contaminated ballast, bilge and other water;

B. The cleaning and flushing of oil tanks at sea;

C. Accidents, both to the ships themselves, and more particularly to tankers' valves and pipe lines during the fuelling operation. The use of the oil tanks for carrying ballast water, when the ship has consumed the bulk of the oil and when it is light of cargo, and the carriage of oil in the otherwise useless space of the double bottom, offer such advantages as would ensure their general adoption, but for the absence of facilities for pumping out this ballast water in port.

The practice of carrying refuse, sewage and other waste materials out to sea to be dumped is so universal as naturally to give rise to the question why refuse oil cannot be dealt with in the same way. We are indebted to the United States Bureau of Mines for an

extensive investigation of this question, in the course of which samples of crude oil and of Diesel oil suitable for motor ships were agitated in thin films for many months on the surface of sea water, simulating as nearly as possible the condition of oil on the surface of a wind-swept sea. The result showed conclusively that the oil was indestructible, and the summary of the report stated "The Bureau experiments showed that when heavy asphaltic fuel oils are agitated with sea water, viscous emulsions are formed which, after months of standing, continue to float on the surface of the water." Unlike other sources of pollution, therefore, the contamination of the sea by oil is persistent and cumulative.

The fact of oil pollution is undoubted, and frequent and serious representations have been made by the authorities of the sea coast towns, particularly in this country and America, for the compulsory application of some means of avoiding the nuisance. In both countries legislation has been passed to deal with the problem. In this country, under "The Oil in Navigable Waters Act" (1922) it is an offence for oil to be pumped overboard from any vessel within British territorial waters. In an official report published by H. M. Board of Trade in 1925, following an inquiry, the statements of more than sixty local authorities from the more important sea-coast towns were given, serious complaints being made of the pollution of their beaches, of the wholesale destruction of fish and sea birds, of harbour fires and the destruction of fisheries, and of bathing being rendered impossible at certain states of the tides. In the United States a similar enactment, "The Oil Pollution Act, 1924," provides for the punishment by a fine not exceeding \$2500, nor less than \$500, with or without imprisonment not exceeding one year nor less than 30 days, for each offence of discharging or permitting the discharge of oil upon the coastal navigable waters of the United States, and the report to the Secretary of State for the purpose of the International Conference in Washington in 1926 gave abundant evidence showing that the evil of oil pollution was felt to an even greater extent in the United States than in this country.

The effect of pumping oil overboard from seagoing ships can be summarised as follows:

1. Loss of valuable oil.
2. Danger of fires in harbours and creeks and increased fire risks to wharfs and quays, through the accumulation of masses of waste oil.
3. Damage to the paintwork of boats, yachts and structures on the sea board.
4. The destruction of fishing nets and the driving away of fish from the natural feeding grounds by the presence of oil; also the destruction of immature fish, and particularly of shell fish in their motile condition, by the exclusion of air by the surface layer of oil.
5. Discomfort to bathers and other users of the beach and damage to their clothes and boots, with the resultant loss to the livelihood to those depending upon the seaside.

* Read at the Joint Meeting of the Chemical Engineering Group and the Liverpool Section at Liverpool on Dec. 10, 1927.

6. The destruction of sea birds, which die a lingering and painful death through the feathers becoming impregnated with oil.

Of these, the last, which is, perhaps, of the least importance economically, at the same time constitutes the greatest reflection upon our civilisation. "Those who

FIG. 1

frequent our coast have no need of the great mass of evidence of the cruelty to sea birds due to the continued discharge of oil. In such places, particularly the Isle of Wight and the Firth of Forth, and, in fact, all round our coast, the sight of dead or dying sea birds, with their feathers clogged with oil, is so common that the societies whose special function is to protect bird life and prevent cruelty to animals are insistent that effective measures

FIG. 2

should be taken to deal with this problem. There is no means of escape when once the plumage of the bird is fouled. On one day in May, 1925, 27 birds were seen dead, coated with oil, between Filey and Hunmandley Gap (a distance of about 1½ miles). Mr. H. S. Gladstone, M.A., F.Z.S., has found, in addition to guillemots, razor-

bills and scoters, a number of puffins, eiders, long-tailed ducks, gannets, and even some wagtails and starlings, and other and rarer birds, which have met their death by contact with waste oil. The photograph, Fig. 1, shows birds washed up on to Freshwater beach during a single tide, and Fig. 2 shows another bird which must have died in agony from the same cause.

This loss to seaside communities and the injury to health of the bathers affected are factors of some national importance. Reports from sea coast towns of the great interference with bathing are almost universal around the coasts of England and America. Bathing at Stanshaw, Portsmouth, is reported to have been completely stopped owing to oil from Portsmouth Harbour. The trouble has been noticed, also, at Mablethorpe, Sheringham, Aldeburgh, Felixstowe, Walton-on-Naze, Clacton, Herne Bay, Margate, Broadstairs, Ramsgate, Dover,

FIG. 3

Folkestone, Hythe, Bexhill, Seaford, Brighton, Worthing, Littlehampton, Bognor, the Isle of Wight, Portsmouth, Crofton on Southampton Water, Swanage, Weymouth, Teignmouth, Salcombe, Ilfracombe, Colwyn Bay, St. Annes, and Blackpool.

At one point where careful records were taken, it was shown that of one hundred possible bathing days, bathing was rendered impossible on twenty-three owing to the presence of oil, and the actual loss in destroyed bathing suits and towels at one bathhouse in Galveston, Texas, was estimated at \$2000 in a single season.

While our compassion is aroused by the sight of sea-birds starving to death or a helpless prey to their natural enemies on account of their inability to fly, and public feeling protests against the discomfort experienced by bathers meeting a patch of waste oil, the economic side of the question is even more serious. It has been

estimated that the total loss of oil discharged into the sea every year amounts to no less than 500,000 barrels, worth, approximately, £250,000, and the United States Shipping Board gave, in December, 1925, an estimate that if only half the ships entering New York Harbour in ballast, pumped out that ballast in the harbour, there would be poured into the harbour 5500 tons of oil annually. On the assumption that the ship would normally commence to pump ballast water 12 hrs. before entering the three-mile limit, and taking into account the prevailing winds along the Atlantic Coast, which are mostly off-shore, as shown in Fig. 3, the estimate was made that the total quantity of this oil which would be permanently washed on to the New Jersey and Long Island shores would be, allowing for ballast water alone, some 1.65 lb. of oil for each linear foot of beach per annum, or, estimating the other sources of oil pollution, a total quantity of 2 to 3 lb. per foot could be expected. This would account for only some 17% of the total oil pumped from the ships entering New York Harbour, but no suggestion is advanced as to the destination of the other 83%, which, on account of its indestructible nature, must eventually be carried by tide and wind to some shore.

Risk of fire is emphasised in a report from Liverpool, and in the fact of two fires directly traced to oil in Portsmouth Harbour, and is supported by the statement of the New York Fire Department, "that this is still the greatest fire hazard with which they have to contend." A special report on fires resulting from oil pollution was made by the United States Bureau of Mines to the Inter-Departmental Committee at Washington in 1926.

The presence of oil is undoubtedly the reason for those movements of the feeding grounds of the fish which have been very noticeable within the last ten or fifteen years, so much so that in many instances fishing fleets have altogether left certain districts and in others they have to go very much further afield for their catch, both resulting in higher costs and prices for fish. This results in raising the cost of living, not only directly, but indirectly, by creating an increased demand for meat and other foods, most of which have to be imported. Oil pollution thus has an undoubted, though perhaps small, effect on those of our present industrial troubles which arise from the high cost of living.

Whilst the evidence as to the destruction and driving away of fish and the destruction of fishermen's nets is overwhelming, there has been some difference of opinion as to whether oil had any deleterious effect upon the fish themselves. This matter seems to have been definitely settled by the work (published in 1926 in the *Journal du Conseil International pour l'Exploration de la Mer*) by Mr. D. Hayden Roberts, who made a series of tests with three-inch fish to ascertain the result of immersing them in sea water in which a range of oils varying from thin Diesel oil to the heaviest asphaltic crude oil had been shaken up. In all cases the fish rapidly lost equilibrium and subsequently died, in periods varying from 3 to 26 min.

Stephen has shown that pelagic larvæ, such as plaice and flounders, are adversely affected in water covered with a film of paraffin 0.03 mm. thick.

Weigelt showed that fish completely disappeared from pools and lakes into which mineral oil was discharged.

Jee and Roberts found that fresh water shrimps are killed by contact with fuel oil, and that caddis larvæ and fresh water shrimps are killed by contact with fuel oil extract. At the last Colchester oyster feast, 1927, the limiting of the supply of oysters to six per person for, it is believed, the first time in the history of that function, was stated to be due to the adverse effect on the oyster beds of oil pumped from ships.

The price and scarcity of oysters in this country and the United States provide evidence that their development has been impeded by some cause of recent occurrence, and this supports the belief, based on experiments, that oil has a very harmful effect on the development of these molluscs while in their immature and motile state. The oyster industry of the United States is estimated to produce over 15 million dollars worth of food per year, or the equivalent of 400,000 dressed oxen, while the total value of the fisheries products of the United States approximates to 80 million dollars per annum. One investigator, reviewing the problem in the broader sense, considers that "oil, gallon for gallon as thrown out, to be the most destructive to aquatic life of all the foreign substances now entering coastal waters."

Before discussing the methods of dealing with the problem, it is, perhaps, useful to analyse exactly what has to be done. Large oil-using ships will pump from 1000 to 2000 tons of ballast water at the end of each voyage, and this will normally be carried in tanks of up to 200 or 250 tons capacity. The average content of oil in each tank will be from 2 to 3%, and the bulk of this (probably 95%) will be floating on the top of the water, and will be discharged in a body when the bottom of the tanks is reached. It has been demonstrated that this 95% of the oil is in masses averaging more than 0.2 mm. in diameter, which will rise to the surface of the mixture, if eddy currents are avoided, in from 1 to 2 min. The balance of 5% or so of the oil can be divided into two forms, which the American Bureau of Standards has designated as "suspended" and "emulsified" oil. The suspended oil, consisting of particles of from 0.01 to 0.2 mm. in diameter, which will settle out in water free from disturbing currents in 2 to 4 hrs. There remains a small quantity (0.1 to 0.5%) of oil in a truly emulsified form, which is still completely dispersed in the water even after months of standing in a quiet condition.

On the score of economy it is important that the time lost in port between voyages should be as short as possible, and one of the great advantages of oil—the rapid fuelling of the ship—would be lost unless the oil tanks can be rapidly emptied of ballast water. This pumping operation should not occupy more than 10 hrs., and the oil-water mixture must therefore be dealt with at a rate of 100 to 200 tons an hour, and must give an effluent of such oil content as not to produce a film on the surface of the water. The thickness of oil films has been studied particularly by Lord Rayleigh, Devaux, Hoog, Hardy, and Langmuir, and Devaux estimates that an oil film has an ultimate thickness of about 1×10^{-7} cm., while D. H. Roberts has prepared, in the course of his experiments, oil films having a thickness of 0.0000195 cm. On this basis, 1 gall. of fuel oil would produce a film over an area of more

than 1100 acres, so that the permitted oil content of the effluent water should be extremely low. The specification of H.M. Admiralty for a satisfactory plant demands a continued test at the full rated output of 200 tons an hour, for 10 hrs., with an oil content in the ballast water varying from the normal washings of a tanker, say 5% up to 15%, of Navy fuel oil, the average content of oil in the effluent water not to exceed 0.0005%, i.e., 1 part in 200,000.

With a problem of this magnitude and importance there have naturally been many attempts to produce satisfactory plants for the purpose, and the development is, perhaps, best traced from the records of the patent journals, where we find that the first patent was taken out by I. F. McDougall in 1892, which, in common with the "Rocket" separator of H. M. Alexander, patented in 1923, the White-Conyn separator of 1923, and the H. & H. Dehydrator of 1924, depended upon the tendency of the oil to rise through the water and up a channel decreasing in sectional area, or up the sides of a cone to the oil outlet. The illustration (Fig. 1) of the "Rocket" separator of H. M. Alexander is typical of this form of construction.

Another type illustrated by the J. Nicolaussé patent of 1903 (Fig. 5), including that of W. E. Lake of 1904, and the Pirbright separator patented by F. Pink in 1923, and to some extent also the J. H. Palmer patent of 1921, follow a different method, in which the mixture is made to pass along the bottom of a rectangular tank of cross section gradually decreased by an inclined roof, the oil being arrested by a series of baffles across the length of the tank and ascending, passes in a direction opposite to that of the mixture along the inclined upper surface of the tank to the oil collecting point. The Nicolaussé separator can be taken as typical of these, although

FIG. 4

certain of them incorporate other features, such as heating coils for the oil, air vents and automatic oil discharge gear.

Two other types of separator were produced prior to 1925, the one illustrated by the Sir James McKechnie patent of 1923, consisting of a series of concentric passages through which the oily mixture is made to pass, the oil ascending to the top of the vessel, which

is inclined to facilitate its collection at a central discharge point. Another type is illustrated by the Conduit separator of R. C. Knight and H. C. Smith of 1923, and the Fisher separator, an American invention, both of which provide a long vertical passage for the oily mixture, in the latter the separation of the oil being

FIG. 5

facilitated by a spiral screw to the lower surface of which it is intended the oil shall adhere in the passage of the mixture through the apparatus.

One characteristic of all the designs mentioned is that increase in capacity can be obtained only by increasing the size of the vessels, and therefore the cross sections of the passages through which the oily mixture has to pass. It is obvious from the figures given of the size and time for separation of the bulk floating and emulsified oil respectively, that one essential feature of a satisfactory separator must be the absence of eddy currents, as if there is any substantial amount of eddying the oil particles, even of moderate size, cannot be separated by gravitation. A consideration of the designs shown would indicate that the baffles, while reducing the effective cross section of the separators, would tend to promote rather than to reduce eddying, but in any case the throughput demanded in practice from these plants is such as to render steady flow out of the question. Applying the well-known criterion of Reynolds to determine the limiting velocity at which steady streamline flow is possible in a circular pipe, we have where v = the velocity of flow, d the diameter of the pipe, μ the viscosity and ρ the density of the fluid $\frac{vd}{\mu/\rho}$ must not be greater than 2000.

For water at normal temperature the substitution for μ/ρ gives :-

vd must not be greater than $\frac{1}{40}$ ft.²/sec. The volumetric rate of flow Q through a pipe of diameter d is $\frac{\pi d^2}{4} \times v$.

Hence we see that Q must not exceed

$$\frac{\pi d}{4} \times \frac{1}{40} \text{ ft.}^2/\text{sec.}$$

$$\text{or } \frac{\pi d}{160} \text{ ft.}^3/\text{sec. if } d \text{ is in feet.}$$

* For a throughput of 200 tons per hour d is obtained from the equation :-

$$\frac{200 \text{ tons}}{\text{hour}} \times \frac{35 \text{ cb. ft.}}{\text{ton}} \times \frac{\text{hour}}{3600 \text{ secs.}} = \frac{\pi d^3}{160} \text{ cb. ft./sec.}$$

$$\text{i.e., } d = \frac{200 \times 35 \times 160}{3600 \pi} = \text{approx. } 100 \text{ ft.}$$

so that if eddying is to be avoided in a simple, circular

pipe, which in itself offers the best conditions for streamline flow, for a throughput of 200 tons per hour, the diameter would have to be 100 ft., and for any cross section other than circular the dimensions would need to be even greater.

It is obvious, therefore, that unless special precautions are taken to avoid eddying, the cross section of these types of separator must be extremely large for a reasonable output. Further, very misleading results may be obtained by experiment on small-scale models, in view of the fact, not always appreciated, that for steady conditions the permissible throughput increases only as the diameter, and not as the square of the diameter, as would perhaps be expected.

In the separator invented by Hele-Shaw and Beale in November, 1925, this difficulty has been avoided by providing for increased throughput by the multiplication of the same standard tube unit, which is used even in the smallest sizes, and as the number of tubes which can be packed into a given space varies as the square of the diameter streamline conditions can be maintained in machines of reasonable size.

In its simplest form the separator consists of a cylindrical vessel containing a large number of tubes of small diameter ($1\frac{1}{2}$ in.) arranged between two tube plates so placed that the whole of the oily mixture flows through the tubes. The tubes are perforated along their upper surface to provide for means of egress of the collected oil into still water, there being a direct connexion between the dead space round the tubes and the oil collecting outlet. The length and diameter of the tubes are so arranged that steady streamline flow is ensured when the separator is working at anything up to 50% above its rated output, while the dimensions of the whole plant are adjusted so that there is ample time during the passage of any given volume of oily mixture through the plant for the complete separation of all the oil which can be removed by gravitational means.

It has been recognised for some time past that it is impossible, without the aid of a filter or some coagulating device, to remove from the water the last traces of emulsified oil, and to bring performance to the very high standard needed if the formation of oil films is to be prevented. Various means for removal of this last trace of oil have been suggested, including electrical precipitation, depending upon the slight electrolysis of the water, in which it was hoped that the liberated ions would carry the oil to one of the electrodes, precipitation by alumina, and the filtration of the resulting precipitate with which the oil would be entangled, and the use of plain filtration methods, through cotton wool, felt pads, cow hair, and layers of cotton or linen towelling. All these methods have met with some success, particularly on the small scale, but the conditions of large throughput with low back pressure have militated against the use of materials which have a tendency to felt, whilst the objection to the towelling is high back pressure and the cost and trouble of frequent renewal. It has been suggested that the organic fibres mentioned could be effectively cleaned by organic solvents, but this would necessitate removal from the filter, and would seem to prevent their convenient application, especially on ship-board.

A type of filter has been devised to work in conjunction with the Stream-Line oil separator, which depends upon the adhesive properties towards oil of the surface of glass silk. The actual construction of the filter unit is shown in Fig. 6. The glass silk, the filaments having a diameter of 0.009 in., is pressed into an annular basket consisting of galvanised wire mesh or galvanised expanded iron, so arranged that the thickness of the glass silk layer is equal throughout. The advantages of this material

FIG. 6

are (1) it has the very high surface area of over 9000 sq. ft. per lb. (2) It will deal with a very large quantity of water before needing cleaning, as each lb. will attract to itself 2.83 lb. of oil before becoming clogged. (3) Its back pressure is negligible, and on account of its structure it does not tend to pack down and impede the passage of water, even after long use. (4) The glass silk is not in any way injured by steam, so that the filter can be completely cleaned by reversal with steam, which

removes the oil and leaves the surface of the glass silk in a condition to take up readily further quantities of oil.

A number—usually three or seven—of these filter

separates as bulk oil. The efficiency of this steam-cleaning operation is illustrated in Fig. 7, taken from the records of a 50-ton unit, which has run continuously

Fig. 7

units is suspended in a mild steel rivetted or welded casing from a top plate by means of a cast-iron top member. This facilitates drainage of the elements during the cleaning operation, when steam is admitted

from November 8, 1926, to May 27, 1927, 10 or 11 hrs. a day, of which from 9 to 10 represented running times with an oily water from the separator, containing from 0.001 to 0.004% of oil. It was not anticipated, when

Fig. 8

in the reverse direction and blows out the collected oil, which runs into the bilges, from which it is in due course pumped through the separator and at once

the test was started, that the change from the clean condition to the clogged condition of the filter would be so sudden. This period, from clean to dirty, which was

just over 10 hrs. at the commencement of the run, had fallen to something over 8 hrs. after 6 months' continued running. This decrease was believed to be due to the fouling of the surface by solid particles carried in with the oil.

Fig. 8 illustrates a complete plant consisting of one separator and one filter unit. A is in the direct pipe line of the ship's bilge or ballast pump, and here the

the filter, entering the unit L and ascending the centre of the annulus M, whence it passes to the connexion to the bilge line N and so overboard. For cleaning, valves N, O are closed, P is opened, and steam is passed in reverse direction through the filter medium for an hour or less according to its condition.

Reference has been made to the year 1925, for the reason that the United States Bureau of Standards and

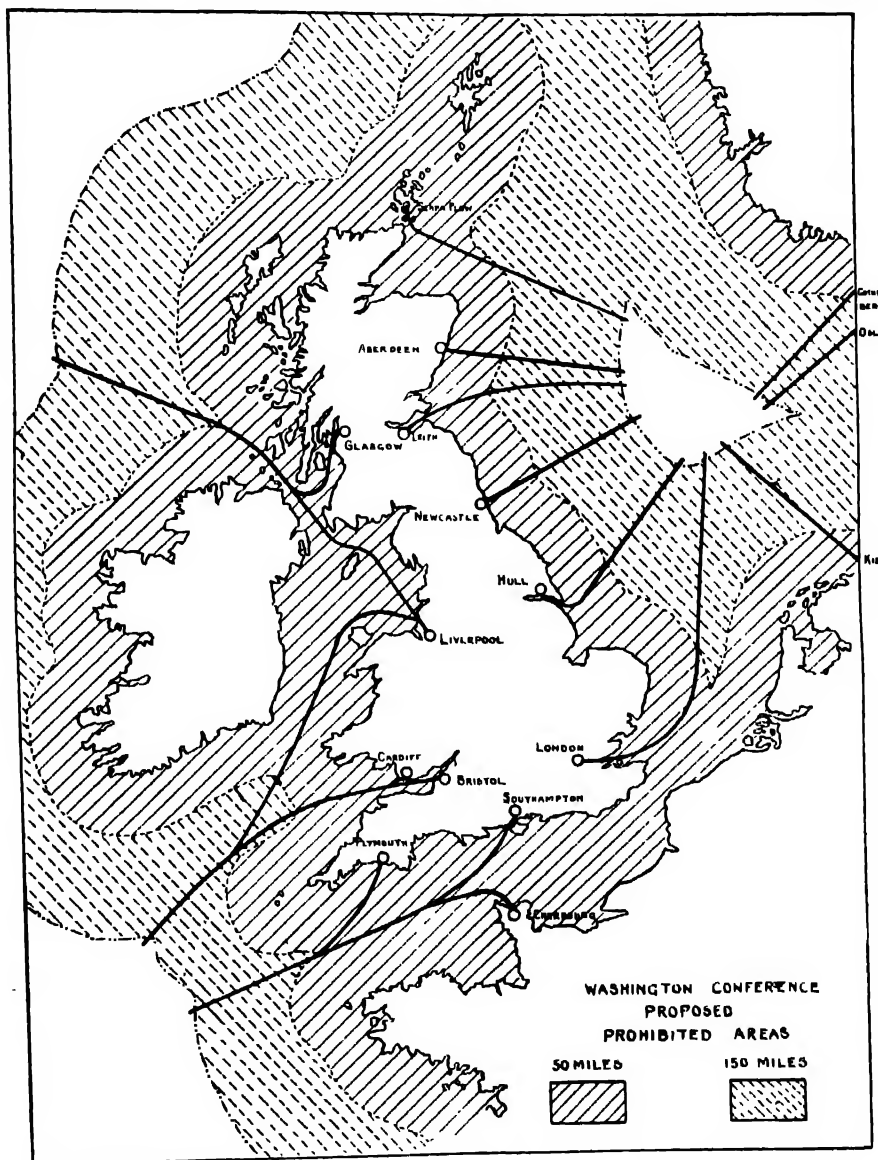

FIG. 9

oily mixture enters. Some of the bulk oil separates at once in the two chambers B, assisted by the baffle C—the water passes on through the tubes DD, the oil escaping through the perforations and thence through the port E into the oil collecting chamber F, from which it is periodically returned by opening the valve on the return G to the ship's oil tanks. Two test cocks, H, J, serve to indicate the necessity for this. The water, now containing only some 0.001 to 0.004% of oil, passes into

Bureau of Mines then reported to the Inter-Departmental Committee for the Washington Conference:—

"1. No thoroughly reliable and adequate methods and devices are yet generally available for the proper disposal of the large quantities of oil-contaminated ballast water and other oil wastes from ships.

"2. Several of these devices now in use on ship-board may be expected to remove from 95 to 99% of the oil found in ships' ballast water.

"3. The oil content in the water effluent from the most successful separators on ship-board would not usually average more than 0.01 of 1% of the total mixture."

From this it is evident that none of the separators

be satisfactory for ships' ballast water to be pumped at a distance of 50 miles or, in congested areas, 150 miles from shore. That this is quite an unsatisfactory position in which to leave the matter is evident from the established indestructibility of the oil, which ensures

FIG. 10

Profile of lighter, as fitted. Stream-line oil separator in Admiralty lighter C73

produced up to that time was able to give an effluent of the high standard required and demanded by the British Admiralty. It is believed that the low standard

that no matter where it is pumped it will ultimately, by the action of wind and wave, reach some shore, and it is particularly unsatisfactory for this country,

FIG. 11

of performance of the separators then available was the cause of the decision of the International Conference at Washington, contrary to the strong recommendations of the technical representatives of the United States and of Great Britain, that, as a temporary measure, it would

owing to its island position, a comparatively short distance from other islands and from the European mainland. A map of England (Fig. 9), with (on the same scale) the borders of an area 50 miles in the one case and 150 miles in the other case, from land, shows that

the distances from British ports at which it would be permissible to pump ballast water are :—

	To limit of 50 mile area	To limit of 150 mile area
Liverpool	270 miles	380 miles
Southampton	250 miles	350 miles
Bristol	150 miles	330 miles
Cardiff	130 miles	310 miles
London	150 miles	320 miles
Newcastle	50 miles	150 miles
Hull	60 miles	180 miles
Glasgow	170 miles	280 miles

Thus a ship entering Liverpool would have to pump out its ballast water and come a distance of 270 miles in the one case and 380 in the other, with its ballast tanks empty, through the Irish Sea. Similarly, a boat entering Southampton would have to pump ballast tanks empty west of Ushant, and come from 250 or

another shore. It might be of some slight service to New York and the Atlantic coast of America, where the prevailing wind is, as already shown in Fig. 3, largely off shore. A cure for the oil pollution nuisance is now available in a really efficient separator, which will give an effluent containing less than 1 part of oil, in 200,000 of water, which can be put in the ordinary bilge line, and operated, without extra power or attention, by the ordinary ship's bilge pump. The question as to whether there is greater efficiency in using a relatively smaller number of separators fitted to barges stationed in the principal harbours and making it a regulation that all ships should pump bilge or ballast water through these harbour service vessels, or whether the separator itself should be actually installed on board the ship,

FIG. 12

350 miles up the Channel without ballast water. Even this highly dangerous proceeding would not ensure that the oil would not reach English shores within a few days of the boat entering port. It is to be expected that the shores of Great Britain would be regarded as a congested area, and that the necessary distance for pumping ballast water would be 150 miles. The condition of the small patch of sea around the Dogger Bank, into which would be constantly pumped the ballast water from the ships entering Newcastle, Hull, Tilbury and the Thames, Gothenburg, Oslo, Esbjerg, Kiel, Antwerp, Rotterdam, can well be imagined. The pumping of ballast tanks 50 or 150 miles from shore, while in itself a dangerous proceeding, in no way ameliorates the evils of oil pollution, but, on the contrary, would tend to aggravate these, for instead of the oil being spread over a long seaboard, the action of wind and tide would carry it in bulk now to one and now to

was fully discussed by the U.S. Shipping Board in its report to Washington, and it concluded that the balance of advantage was enormously in favour of fitting the separator to the ship as soon as a satisfactory and efficient separator of reasonable size and capacity was available. The illustrations show typical installations, Fig. 10, of a barge plant of 200 tons per hour in use by H.M. Admiralty; Fig. 11, the plant of 150 tons per hour installed in S.S. "Majestic"; Fig. 12, of a standard 50-ton plant fitted to one of a number of vessels of the Grace Line, built by the Furness Shipbuilding Co.; Fig. 13 shows the Admiralty plant in course of construction, and Fig. 14 two 50 tons per hour separators ready for shipment.

Some interesting points arose in the two-day acceptance trials of the Admiralty barge, which took place on June 8 and 9 last, when two lots, each of 1000 tons of water, contained in four tanks of the R.F.A. tanker

"Linol," were pumped through the plant in a total period of 10 hrs. During the first 5 hrs., the mixture to be dealt with was tank washings, containing from 1 to 2% of oil, while during the second period mixtures of sea water with 5%, 10%, and 15% of Navy fuel oil was separated. Owing to the viscous nature of the oil and the large quantities of air pumped with it at the end of each tank, it was found necessary to run the plant at a rate exceeding 300 tons per hour, in order to obtain the necessary average of 200 over the period. Fig. 15 gives the curve of output during the 5 hr. runs.

It has been alleged as an objection to the compulsory fitting of separators that they would add another and

three weeks as the period between bunkerings, a minimum of £500 per annum. These figures take no account of exceptional circumstances such as contamination of oil through accident or leaky tanks and the recovering of the sludges which settle out from certain crude oils, in which the separator offers very large economies.

The plant installed in s.s. "Majestic," already mentioned, owing to exceptional circumstances, recovered upwards of 200 tons of oil on its first voyage from tanks in which residues had been accumulated. This oil was burned directly under the boilers. This particular installation also illustrates the facility with which the shape of plant can be adapted to fit into any awkward and

Fig. 13

intolerable burden of expense and waste of valuable cargo space of the shipping industry at a time of serious depression, and when it is still suffering from those difficulties which are an aftermath of the European War. An impartial examination of the facts in conjunction with the figures given by the United States Shipping Board completely disposes of this argument. An oil-burning vessel when in water ballast has from 600 to 1500 tons of water containing at least 1% of oil. This 10 tons or so of oil can be recovered without any additional expense, as the cost of pumping is the same whether the water goes through a separator or directly overboard. A plant of 100 tons per hour capacity, which can be installed for less than £1000, would therefore earn a return at least £30 per voyage, or, taking

otherwise useless space; in this case the corner of the fan room. A part of the double bottom or the cofferdams of oil tankers amongst other positions are equally available without any encroachment on cargo space. The proposal of the Washington Conference that the space occupied should be deducted from the effective tonnage for the calculation of port, canal and similar dues offers a further economy.

The analysis of samples of effluent containing quantities of oil of the order of 0.0001 to 0.0005% presents considerable difficulty; in fact, the United States Bureau of Mines, in its report, states "that the quantity of oil is hardly sufficient to permit of analytical determination in a sample of moderate size."

A comparative study of three of the recognised methods

of analysis was, therefore, made on samples which were carefully made up from a standard solution of fuel oil in ether, and from which the ether was allowed to

Fig. 14

evaporate after thorough shaking with the sea water. The methods used were:

(1) Extraction, with careful washing of the bottle also, with pure benzene, filtration of the benzene after

(3) A thorough mixing of the sample with a solution containing 0.5 gr. of aluminium sulphate, precipitation with excess of ammonia, filtration of the alumina, drying at 100°, and Soxhlet extraction of the dried precipitate, evaporation of the benzene from the extract at a low temperature, and drying to constant weight of the residue of oil.

Comparative analyses of oily mixtures

Average of five determinations

Standard oil content	I Benzene	II Chloroform	III Alumina
0.0001%	0.00013	0.00012	0.00010
0.0002%	0.00025	0.00026	0.00023
0.0003%	0.00034	0.00033	0.00031
0.0004%	0.00045	0.00042	0.00039
0.0005%	0.00058	0.00057	0.00048
0.0010%	0.00132	0.00118	0.00097

It was anticipated that all these methods would give low results on account of the expected loss of some part of the fuel oil in the drying process. It was found that, on the contrary, nearly all the results were higher than the standard, while where the filtration of the extract was omitted, the results were 30% to 70% high, probably because the oil had taken up particles of solid matter floating in the water.

The separator has also been applied on land to the recovery of oil from the rain water and washings from

Fig. 15

separation with an ordinary separating funnel, and evaporation at a low temperature with subsequent drying to constant weight at 100° C.

(2) A similar extraction with chloroform and drying to constant weight at 100° after filtration.

oil storage yards—for dealing with the oily and tarry effluents from gas works and water-gas plants, and similar industrial wastes. The special form of filter is of service for the de-oiling of condenser water for boiler feed.

OUR DELIGHT IN BAD LANGUAGE

J'ai cherché, autant que possible, à joindre, dans l'explication des phénomènes, la précision à la clarté, prenant en cela pour modèle les mathématiciens qui ne se servent jamais d'un terme sans en avoir préalablement établi le sens. Il faudra bien un jour arriver à écrire les livres de la chimie comme on écrit une géométrie ou une algèbre : c'est alors seulement que la chimie se répandra davantage dans les masses.

GERHARDT : *Introduction à l'étude de la chimie*. 1848.

One Paul gave the same message to the Corinthians : whether chemists were among them is not known.

"Except ye utter by the tongue words easy to be understood, how shall it be known what is spoken? for ye shall speak into the air. There are, it may be, so many kinds of voices in the world and none of them without signification. Therefore, if I know not the meaning of the voice, I shall be unto him that speaketh a barbarian, and he that speaketh a barbarian unto me."

Our leader-master takes the fly very easily. He is caught by Calorifer's first cast - by no mere Brown Dun but by a Neogrecian. Perhaps there was art behind the use of such fly - at least, the desire to give an opportunity, possibly to pull-the-leg. The editorial trout is ever an inconsequent feeder - still, the rise was natural. "Epipedonic!" How superlatively superior to Road-hog! The "literary gent" must react to such offer, particularly when he is a young and cautious driver himself. Calorifer's challenge to him to discuss the relation of action to reaction at the angle of the green cushion seems to have fallen flat - he is as unresponsive as Wilder D. himself, *pace* Prof. Bone, though not unaccustomed, we fancy, to leave the editorial armchair for savage lands and follow the lure of rolling ivory - or is it celluloid? If the chessboard or even the bath-mat can be used in displaying the nature of common salt, the character of chemical change may well be demonstrated upon the green cloth. Instead of the desired discussion, however, we have a learned dissertation upon "theory": it seems that the hook must be baited with Greek.

Calorifer has asked that the word may be standardised. *Theory* is now one of those terms, as our Editor succinctly states, used in science "to explain briefly that the writer is not clear in his mind what he does mean" - perhaps a condition not infrequent in the scientific writer. Examples are quoted of its use by all sorts of men in all sorts of ways. He would allow it to have "One Dam Meaning After Another" and deprecates its use with a single meaning. Calorifer should crumple up under such criticism but I fancy he has some element of courage in him and will not easily be put down even by the editorial "We." He seems to have one of those nasty, inquisitive, irreverent minds which leads its owner to say: "Yes! but what's the guy's opinion worth anyway? What are his idiosyncrasies?" The fellow, it is clear, writes as an Editor, not as a chemist. He is known to be a lawyer. Nominally, the lawyer is judicial - in itself a term difficult to define. More often than not the judicial is the synonym of the partial, at least of prejudice - the prejudice of precedent.

The ultimate object of the scientific writer should be to express himself in immutable terms. The lawyer, on the other hand, may favour a multiplicity of meanings, so that there may be room left for dispute - consequently, for fees. The two have interests at opposite poles - witness the struggle over the word *synthesis*. It was worth a lot to all parties concerned, except to the unfortunate people who meant business and wished to synthesise calcium carbide.

Our Editor cannot have it both ways. Either he must be a mere editor and an opportunist or put on the toga scientific and advocate the definite. Herein lies his opportunity. We by no means object to be told that the theorist is the equivalent of the man who watches a football match. The man has a definite game, with clearly defined rules, in his head; also he is a close observer and goes upon facts; he never thinks of the game as played merely by moving arms and legs but has the complete man in mind. Theory must be reserved for high table use, on state occasions, as a vintage word of special import and highest degree, to be carefully cuddled and warmed before use, so that it may fit the precise meaning of the situation. The practice of the best writers justifies such exclusive use. As witness, we give the following from a well-known dictionary:

"*Theory* is distinguished from *hypothesis* thus: a *theory* is founded on inferences drawn from principles which have been established on independent evidence; a *hypothesis* is a proposition assumed to account for certain phenomena etc. It is necessary to keep this distinction in view, as the terms *theory* and *hypothesis* are very frequently confounded, both in speaking and writing."

We have to note that there is a growing demand for technical books written in the English language - not in terms of a thoughtless and offensive laboratory patter. We cannot complain that our science makes little headway in society, when the jargon of the young Royal Society hunters, its Lewisisms, Lowryisms, Morganisms, Ridealisms, Rutherford-malapropisms, etc., makes our writings misleading and unreadable, almost nauseous to educated ears. All our leading words need precise definition. To-day no one can say what is or is not implied by master terms such as catalysis and ionisation, for example: Cambridge, Princeton and Johns Hopkins alike fail to use the former in any rational way. Our minds are muddled, so we muddle our words. Mr. Baldwin has recently been elected into the body scientific under the proviso of the Royal Society's statutes admitting persons who have rendered conspicuous service to the cause of science or are such that their election would be of signal benefit to the Society. It is not known that he ranks in the former category even in connexion with his studies of combustion. His service must, therefore, be prospective. Here we must have fallen asleep and dreamed a dream.

We seem to remember hearing a voice

All was not as it should be in
Our body scientific thin,
So they inducted the Prime Min.
He said they were a priesthood who
Supposedly ver-it-ies 'noo;
But why express them so - pooh, pooh!

Next we heard the question :

Say, Ed., will Baldwin, F.R.S., read Society's stodge ?

No, Sir ! See, here ! New Broom sweeps clean.

Then came pictures upon the wall.

1. Baldwin, P.M., handing file of R.S. Proc. to Cook

2. Cook selling same to Chemistry House grocer.

3. Excited buyers of pounds of butter upon which printing has come off.

We will not buy such But. to-day !

Oh, take this chelate grease away.

This activated fat agley !

4. Grocer, reactant, in dilapidated shop, ruined by selling R.S. bad language as butter.

5. Repentant R.S. on St. Andrew's Day.

And everybody saw with joy

The look upon that Lowry boy :

How thought of Hell him made repent,

And Rid-e-al and Morgan too

Began to feel a little blue,

So up they all their errors threw

6. P.R.S. in Pilgrim's garb, wearing cap bearing La Fontaine's moral : " Les voleurs sont tel ou tel prince." He is hung around with full ballistic kit, Lewis gun, etc. for knocking spots off atom. P.R.S. does penance before Baldwin, P.M., F.R.S., for his rape of the chemist's Ion. He is let off with a warning, on promise to misuse her no longer and to stay all further improper use of such stolen goods by electricians, Fowlers, etc., etc.

In P.R.S. the fear outgrew

That he had put his foot in too,

That he dam well should serve his Lent.,

That he no more should let in those

Who never did with sense compose.

Should make his soc. fit only coves

Who might with credit all be chose.

Who clearly could wear well their clo'es,

And ultimately rise to Joves.

Here Baldwin said : It will be right

If you your thoughts in English write.

And bowed he then to them : Goodnight !

Now all was as it should be in

A body scientific thin.

Give we our thanks to the Prime Min.

Our Editor will perhaps play the Daniel to our dream with its writing upon the wall and interpret its import. At least, we hope that he will make his organ a laundry in which words may be starched and ironed into forms fit for wear in polite society. " *Il faudra bien un jour arriver à écrire les livres de la chimie comme on écrit une géométrie ou une algèbre* "

A few words as to Lucifer's remarks upon my friend Calorifier. The latter, I am sure, is pained, though not surprised, that his friendly efforts to illuminate Darkest Bigdrumbonia are declared a failure. The field of missionary enterprise is strewn with failures—material collected from "Somewhere in Lancashire" is not likely to be plastic. Why Lucifer should be called upon the scene is not clear. He has long been declared out,

both by Prof. Bone and a majority of the bench of Bishops, so the pseudonym is an obvious fake. Moreover, the heading to such diatribe should have been "Ye potte calleth ye kettel blacke."

Say, Bone, where do you get off on Calorifer ?*

The "Tu quoque" argument carries us no further in the analysis of flame. Eggs are often broken over bacon in our isles but Bacon's words break no eggs over the big-drum problem raised by the Verulam Resonator.

Bacon won't do any good to your S.A.

Our friend ever sits upon his experimental basis, as the Mississippi pilot in Artemus Ward's day sat, upon the safety valve while below the boiler was fed with hams. The valve has been known to blow up. He shows pronounced symptoms of *cephalitis enlargica*. We suggest a course of mediavalism that at least he think back to Priestley, probably the greatest experimenter the world has known, yet unable to grasp the special significance of his discoveries. If the effort be too great for a Modernist, he may consider Crookes. Crookes did not understand his radiometer, his reading of his rare-earth work was wrong and he had but faint understanding of the high vacua he created. The one needed a Lavoisier, the other a J. J., to make his work of avail to the world. It is a well-known maxim that "lookers-on see most of the game." The Drybonians have yet to show that they have grasp of the complex geography of the territory which they are surveying.

Anyway, who and what is the experimenter ? Is he so superior a person that he may arrogate to himself the sole right to assess the value of his observations and to jibe at those who modestly offer their criticism ? The experimenter usually works with borrowed ideas and borrowed tools. Those from whom he borrows may at least be allowed to display an affectionate interest in his doings, without being accused of any form of *ism*. Are not our particular friend's wanderings in Drybonia directed by suggestions he has received from others, whether he knew this or not ? Are not they too experimenting but with his vile body, and may not they honestly claim the right to a share in his reappings from their sowings ?

STRUWELPETER REDIVIVUS

THE WASTES OF THE PAPER PULP AND PAPER MILL INDUSTRIES

By J. B. C. KERSHAW

The wastes of the paper manufacturing industry occur chiefly in the production of wood pulp—that is, in the mills which are situated abroad. Attention will be directed, however, in this article to the prevention of waste in all branches of the paper manufacturing industry, for most of the large paper mills in this country depend for their supplies of wood pulp upon subsidiary works or mills in Canada or Scandinavia.

It is over fifty years since the chemical method of preparing cellulose for the manufacture of paper was first introduced, and this branch of the industry has

* See *Punch*, Nov. 9, p. 510.

undergone very remarkable developments during the past half century. Esparto grass in recent years has become a very important raw material, and the original soda process for disintegration of the ligneous fibre of the wood has been to some extent supplanted by the acid sulphite and sulphate processes, since these produce, without the aid of any bleaching material, a much whiter pulp. By skilful manipulation of the acid sulphite process it is possible, in fact, to obtain a cellulose material with long fibres, which can be used for the production of a strong paper, without the help of any sizing or weighting materials. This feature is tending to increase the use of the acid sulphite process for the supply of raw material to British and American paper-making mills. The latest method of preparing cellulosic material is based upon the use of chlorine gas, and one of the

of these materials is not based entirely on their intrinsic value, for it is absolutely necessary, in most cases, that the waste liquors should be purified before they are turned into streams and water-courses, since in their unpurified state they may cause great destruction of fish life and vegetation.

The difficulties in dealing with these waste liquors are due partly to their dilution, and partly to the large number of different chemical compounds which they contain. An immense amount of research and experimental work is now being devoted to the treatment of the waste liquors from the sulphite and sulphate processes, and although up to the present no method of treatment has gained general acceptance, considerable progress has been made, and there is no doubt that in time the problem will be solved. Before giving details

FIG. 1

Soda, chlorine and pulp works of the "Electrochimica Pomilio" Co., Ltd., at Naples. Pulp department and boiler house

leading Italian mills is now producing a high-class pulp from esparto grass by this method of treatment.

None of the chemical methods yield, however, more than 50% of the wood or vegetable material in the form of cellulose, and quite one-half of the weight of the raw wood, consisting of the lignin, carbohydrates, resins and albuminates is carried away in the waste liquors.

Signor Pomilio, one of the leading Italian paper manufacturers, has calculated that 672,000,000 cb. ft. of wood is employed annually for paper manufacture in America alone,¹ and when one adds to this huge total the wood consumed in Canada, Norway, and the other timber-producing countries of Europe for the production of chemical pulp, it will be realised that many millions of pounds of valuable organic substances are being lost each year in the waste liquors of the wood-pulp industry. The argument for the recovery

of these investigations, however, it will be advisable to outline the present methods of wood-pulp manufacture and the present methods of dealing with the waste liquors.

Mechanical wood pulp

This process is employed for non-resinous long-fibred woods, such as spruce and balsam. The wood is cut into 2-ft. lengths after removal of the bark, and is then pressed against the side of a grinding stone which has been roughened so as to produce a cutting action. The yield of pulp based on the weight of the dry wood is 90%, but it is of inferior quality and is only employed, with longer and stronger fibred stock, in the manufacture of papers of the cheaper type, such as newspaper, cheap catalogues and cheap magazines, for which paper with good durability is not required. The waste from this method of reducing wood consists principally of "slivvers" of wood about the size of match sticks,

and amounts to about 5% of the weight of wood passed through the mill. In many mills the "slivers" are re-worked, in order to produce a cheaper grade of paper.

The sulphite process

This process is used for the pulping of long-fibred non-resinous coniferous woods, such as spruce, poplar, balsam and hemlock, and, based on the dry weight of the original wood, a yield of less than 45% is generally obtained. The chemical employed is calcium bisulphite, produced by the action of sulphur dioxide upon lime. The pulp produced can be obtained in a high degree of whiteness, and is used both bleached and unbleached for the manufacture of book, news, wrapping, bond and tissue paper. One gallon of undiluted sulphite waste liquor, which carries in solution one pound of dissolved lignin and resins, is produced as waste for every pound of cellulose by this process, and as only 60% of the concentrated liquor can be drained from the pulp after its discharge into the blow-pit, it is usual to wash the pulp and thus to add another 3 gals. of waste water to that already produced.

The sulphate or "Kraft" process

This process is employed with either resinous or non-resinous woods such as pine, spruce, hemlock, poplar and fir, and is based upon the use of a mixture of sodium hydrate and sodium sulphide for opening up the wood. The yield of cellulose obtained is generally less than 45%. Kraft pulp is usually left unbleached, and on account of its strength is employed chiefly for the manufacture of wrapping paper, or to produce the board employed in the manufacture of food containers.

The waste from the Kraft process is much smaller in volume than that from the sulphite mills, since the spent liquor from the digesters and all of the wash water is evaporated and incinerated, in order to recover the soda. The chief waste material, therefore, is the lime sludge which is produced by the causticising of the liquor for further use; and in most cases this is disposed of, either by discharging it into streams, dumping it on the land, or selling it as a fertiliser.

The soda process

The soda process of manufacturing wood pulp, although the oldest, is restricted to the treatment of short-fibred deciduous wood, such as aspen, cotton-wood, willow, and gum; in most cases a yield of less than 45% is obtained. The chemical employed is commercial caustic soda, and the resulting pulp is always bleached to a high degree of whiteness. It is employed with the longer and stronger fibred pulp stock, such as spruce sulphite, for the manufacture of book, lithographic, and envelope papers. The methods of dealing with the wastes from the soda process are the same as those employed for the Kraft wastes; but appreciable quantities of carbon are found in the wash-water from the recovery plant of the soda process.

"White-water" wastes

"White-water" is the technical name given to the waste from pulp-paper mills carrying the finer particles of cellulose, and it is imperative for the profitable working of a wood-pulp or paper mill that this source of waste

should be stopped. In recent years a considerable development of more efficient types of equipment for this purpose has occurred on both sides of the Atlantic. The improved plant has been either of the *filtering* type, in which the solids suspended in the white-water are filtered through a mat, which may be a paper-making fibre or cloth; or it is of the *sedimentation* type, which allows the solid material to settle to the bottom of the container, where it can be removed by scrapers and returned to the paper-making machines.

The filtering type is the best for the treatment of fibrous wastes containing little or no clay, whilst the sedimentation type is adapted for wastes in which clay is present. The efficiencies obtained from these types of pulp-saver, when intelligently used, are estimated to be over 90%, and the operating costs are low, since very little power is required for running the plant. The capital costs vary from 200 dollars to 500 dollars per ton of paper produced per day, the exact amount depending upon the local conditions and the type of paper made.

One of the preliminary difficulties in all recovery processes is the cost of concentration, for the presence of albumens, fats, waxes and resins adds considerably to the cost of evaporation; and waste sulphite liquors, as a rule, contain only 10% to 12% of solid matter, with a high percentage of organic compounds. The waste liquors from the soda process are much more concentrated, and the cost of evaporation is thus much lower than for sulphite liquors. These alkaline "black liquors," as they are termed, are very destructive to marine and vegetable life; and therefore, wherever the older process is still in use, it is customary to evaporate the liquors to dryness, and to burn the residue, containing all the organic matters, for steam generation.

The solution of soda obtained by lixiviating the ash is then causticised with lime in the usual manner, and the sodium hydrate solution is used again in the process. This may be considered the standard method of treatment of the "black liquors" obtained by the older process of cellulose manufacture, and any improvements recently proposed are simply in the details of the plant by which it is carried out.

For the disposal of sulphite mill wastes no method of treatment has secured general adoption, and the production of ethyl alcohol by fermentation of this liquor has been abandoned in all countries except in Sweden, on account of its prohibitive cost. The production of core-binders, adhesives, turpentine, resins, and tanning extracts has not become general for various reasons, one being that the demand for some of these products is so small, and the supply of raw material so great, that a few plants are able to supply the whole market.

The waste from the sulphate mills, which produce "Kraft" pulp, consists chiefly of lime sludge, and many of the mills now use rotary kilns for burning this lime, and also for the lime sludge obtained from the soda process.

• (To be continued)

The late Mr. J. W. Goddard, of Leicester, head of J. Goddard & Sons, plate powder manufacturers and manufacturing chemists, left estate valued at £202,184.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

BUREAU OF CHEMICAL ABSTRACTS

The following have been appointed by the Council as the Society's representatives for 1927-28 on the Bureau of Chemical Abstracts:—

Mr. J. L. Baker, Mr. F. H. Carr, Mr. E. V. Evans, Sir Wm. J. Pope, K.B.E., and the Honorary Treasurer, Dr. E. W. Smith (*ex-officio*).

BINDING CASES FOR BRITISH CHEMICAL ABSTRACTS AND JOINT INDEX

Abstracts "B" and Index to "A" and "B"

Binding cases for the above publications, in dark blue cloth, will be available, commencing with the 1927 issues.

The price will be 3s. 9d. per set of two cases, postage 6d. extra, or, separately, 2s., postage 3d. extra.

Abstracts "A" and Index to "A" and "B"

Cases are also available in maroon or blue cloth, price 3s. 9d. per set of two cases, postage 6d. extra.

Orders, accompanied with remittance, should be forwarded to Messrs. Gurney & Jackson, 33, Paternoster Row, London, E.C.4.

LIST OF MEMBERS ELECTED

December 9, 1927

- Andrews, Albert E., c/o The Marmite Food Extract Co., Ltd., 52, Camberwell Green, London, S.E.5. Research and Analytical Chemist.
- Briggs, Wm. A., 23, Brighton Gardens, Gateshead, Co. Durham. Works Chemist.
- Clark, K. Lanphier, "The Haven," 94, Wallscote Road, Weston-super-Mare. Works Chemist.
- Clark, Wm. H. D., Houdley, Hadley Wood, Barnet. Patent Expert.
- Guertin, Henry E., The St. Lawrence Flour Mills Co., Ltd., 1110 Notre Dame W., Montreal, Canada. Chemist.
- Hacking, B. Ian, c/o East Lancashire Soap Co., Ltd., Clayton le Moors, nr. Accrington. Soap Manufacturer.
- McCloud, John L., Ford Motor Co. Library, Dearborn, Michigan, U.S.A. Metallurgical Chemist.
- MacCulloch, Nigel J. H., The Rectory, Bridge of Allan, Stirlingshire. Works Chemist.
- Marsden, Wm., 2, West Riding Terrace, Mickley, Stocksfield-on-Tyne. Assistant Analytical Chemist.
- Morse, Wm. M., 400, Graybar Building, 420, Lexington Avenue, New York, N.Y. U.S.A. Editor.
- Nicolls, Jasper H., Fuel Testing Station, 552, Booth Street, Ottawa, Canada. Chemist.
- Nyrop, Johan E., Bel Colle, Hørsholm, Copenhagen, Denmark. Consulting Engineer.
- Reddie, J. Alexander, Bank House, Apperley Bridge, nr. Bradford, Yorks. Chemist.
- Rheinlander, Arthur H., Government Laboratory, Clement's Inn Passage, Strand, London, W.C.2. Chemist.
- Rose, Harry C., c/o Messrs. Jones Bros. (West Bromwich), Ltd., Eagle Oil Works, Albion, West Bromwich, Staffs. Analytical Chemist.
- Saklatwalla, Beran D., c/o Vanadium Corporation of America, Bridgeville, Penna, U.S.A. Vice-President.
- Sera, S., Central Laboratory, South Manchuria Railway Co., Dairen, Manchuria. Superintendent.

Smart, Brig.-Gen. Chas. A., C.M.G., Canadian International Corporation, Ltd., 718, Sherbrooke Street West, Montreal, Canada. Director.

Soff, Le Roy D., 131, East Fordham Road, New York, N.Y., U.S.A. Chemical Engineer.

Suggden, John A., 6, Glebe Terrace, Far Headingley, Leeds. Assistant Lecturer.

Taylor, Austin J., 222, Highfield Street, Moreton, N.B., Canada. President and Manager.

Walls, Ernest, Riversley, Littlefield Place, Clifton Down, Bristol. Manufacturer.

Weir, John, c/o Nobel's Explosives Co., Ardeer Factory, Stevenston, Ayrshire. Research Chemist.

EDINBURGH SECTION

The third meeting was held jointly with the local branch of the Institute of Chemistry on December 6, in the Pharmaceutical Hall, Edinburgh. Mr. J. Adam Watson presiding.

Prof. Sir James Walker, F.R.S., in a lecture on "Electro-synthesis" said that since Kolbe's time the process of electrolysis of solutions of salts of fatty acids had been applied to the preparation of hydrocarbons with straight chains of carbon atoms of over 60 links in length. This he would define as true synthesis. In addition to the saturated hydrocarbon, in some cases the reactions gave other products, particularly the unsaturated hydrocarbon of half the length of chain, and the ester of the acid used.

The lecturer said that whilst working as the assistant of Prof. Crum-Brown, following up a suggestion, he adapted the method to the synthesis of dibasic acids, the product of each step being used as the starting point of the next. Thus starting from sodium ethyl malonate he prepared diethyl succinate and so in turn the esters with 4, 8 and 16 carbon chains between the end groups. Other preparations gave the other members of the even series, the method being quite general. Branched chain compounds were also used. Since the higher members of the various series tended to have a soapy nature, some difficulties were here encountered, but later on his pupils had overcome these by using solvents other than water.

The lecturer pointed out the importance of the methods for the preparation of long chain compounds of known constitution which could be directly compared with similar substances of natural origin with a view to elucidating the structures of the latter. A point of special interest was that the syntheses could be carried out in the cold, thus minimising the risk of intramolecular and other abnormal changes. The methods were not necessarily restricted to unsubstituted acids, but if active groups were present they could be blocked by alkylation. Nevertheless some experiments on these lines had not met with complete success.

Discussing the mechanism of the reactions the lecturer said that three theories had been suggested. Kolbe attributed the reactions to anodic oxidation, later the union of the discharged anions with simultaneous elimination of carbon dioxide was suggested and still later the peroxide theory, introducing the intermediate formation of the peroxide, such as acetyl peroxide, which subsequently decomposed. A variation of the peroxide theory in which nascent oxygen, produced by the action of

discharged anions and water, reacted with acid anhydride to give the peroxide, had also been put forward. He could see no reason for complicating the theory in this way; there was not sufficient experimental evidence to determine the true mechanism. In his own laboratories there were two schools of thought, the theory of direct union and the theory of anodic oxidation sharing the support of his assistants. Attempts to solve the problems of the anode mechanism by the direct study of electrode potential measurements had not so far been very successful.

After the lecture a number of members spoke in appreciation, and questions were asked by Major Bruce Dr. Kermack, and Messrs. Coyne, Ingham, Robertson and Cameron.

In reply, Prof. Walker said that so far as he knew experiments of a similar nature with aromatic substances, proteins and halogen derivatives of fatty acids had not been successful. The benzene ring, even at the end of a fatty chain, in some way prevented the normal reaction from taking place. Similarly, halogen compounds gave no oily synthetic products, complete breakdown resulting or else the ester formation without synthesis. Dr. Gibson believed he obtained a minute trace of hexachloroethane from trichloroacetic acid. Ring closure was another thing which had not been observed in these experiments. On the other hand, interesting reactions with cyclic compounds were possible, and he quoted the case of sodium ethyl camphorate from which unsaturated synthetic products could be obtained in good yield. Dealing further with the constitutions of the products and comparisons with natural substances he showed how melting-point determinations could be successfully used, and if the acids themselves gave ambiguous results the esters could be substituted. He thought that the method of synthesis could be relied upon to give a compound of known constitution. Although the compounds of high molecular weight were either soaps or like soaps, these studies did not appear to have thrown any light upon the colloidal properties of the soaps.

GLASGOW SECTION

A meeting of the Glasgow and Edinburgh Sections of the Society of Chemical Industry and the Institute of Chemistry was held, jointly with the Scottish Section of the Institution of the Rubber Industry, in the Cadoro Restaurant, Glasgow, on December 7.

Mr. S. H. B. Langlands, Chairman of the Glasgow Section of the Society of Chemical Industry, presided and welcomed the visitors. He said that he hoped more joint meetings of the various societies and local sections of the same society would be held in the future. Such meetings would foster a better spirit of understanding between those engaged in the various branches of chemical industry, and would tend to an increased efficiency.

Two papers were read, the first being "Sulphur in rubber manufacture," by Dr. D. F. Twiss, the second being "Naphthas and their uses," by Mr. C. Chapman, F.I.C., A.M.I.Chem.E.

Dr. Twiss discussed the part played by sulphur in the vulcanisation of rubber. By the term "vulcanisation" was meant the changes induced in raw rubber by the

addition of a small quantity of a substance which combined with the rubber to form another substance which was then dispersed. Sulphur had been found useful in producing the desired changes in the character of raw rubber. The fineness of division of the sulphur was very important, but the degree of fineness was limited by incipient melting of the sulphur in the hot process. The partition of rubber and the contained sulphur in a common solvent was discussed, and attention was directed to the different allotropic forms of sulphur. The transformations of the various forms was then discussed with a view to arriving at the conditions upon which vulcanisation proceeded. Stress was laid upon the fact that the desired changes could be produced by adding carbon black in place of sulphur, although the amount necessary was much greater.

The lecturer illustrated his remarks by experiment and by an exhibition of various samples.

A good discussion followed, which brought out the fact that the present view of vulcanisation seemed to be a compromise between the chemical theory on the one hand and the adsorption theory on the other.

Mr. Chapman outlined the various stages in the refining of naphthas, including the removal of the phenolic bodies or tar acids and the distillations of the washed naphthas. He dealt with the production of pure benzene etc. and the "semi-pure" substances, and the isolation of such substances as pyridene, carbon disulphide, and coumarone. It was strongly stressed that while dyestuffs and explosives were certainly produced from benzene etc., yet the naphthas were utilised for many other purposes. The chief uses to which the naphthas were put were the production of motor spirit, dry-cleaning processes, and paint and varnish preparations.

On the call of the Chairman, hearty votes of thanks were accorded to the lecturers.

The Chairman then called upon the Convener of the Ramsay Chemical Dinner Committee to address the meeting.

Dr. Dow said that the Committee was exceedingly anxious that the Ramsay Dinner should be as successful on this occasion as it previously had been.

This year the Ramsay Dinner had been sub-titled "The Institute of Chemistry Jubilee" to enable the event to be celebrated locally.

The dinner was to be held in the Trades House, Glasgow, on Wednesday, December 21, at 6 p.m., when the chair would be occupied by Prof. Smithells, President of the Institute of Chemistry.

MANCHESTER SECTION AND FUEL SECTION

At a joint meeting of the Manchester Section and Fuel Section held in the Engineers' Club, Manchester, on December 2, Dr. James A. Bowie (Director of the Department of Industrial Administration of the Manchester College of Technology) read a paper entitled "A new diagnosis of the coal trouble." Mr. C. J. T. Cronshaw, chairman of the Manchester Section, presided over a good attendance.

Dr. Bowie said that in 1870 the British production of coal was over 50% of the world's production, in the period 1909-1913 it was 25%, and in 1925 only 20.9%. The position of the British coal industry,

therefore, was that we were producing a smaller proportion of the world's coal supplies, a reduced absolute total, and even this total tended to decline, although we were now selling it at a figure in real value well under its 1913 price. From this the conclusion seemed inevitable that the British coal industry was faced with a shrinking demand which would not yield to the stimulus of price reduction.

If that was so, it was not true to say that the present plight of the industry was due to the heavy burdens it had to carry in capital charges, local and national taxation, and high costs of transport. All these certainly increased costs, but their reduction, even if possible, would do no more to assist the industry than had the great reduction—averaging over 2s. per ton—recently effected through wage rates and increased hours. If further disproof of "the heavy burden theory" was needed, one had only to consider the situation of the coal industry in other countries. Throughout the world the coal industry had grown up under conditions which inevitably meant over-expansion, leading to over-manning, low wage rates, and lack of profitability. For a time this congenital vice of the industry might be veiled by a continually growing demand, as up to 1913, by the gradual operation of diminishing returns, or by a reduction in hours, as in Britain in 1919, but under static conditions it was certain to assert itself.

Rich prizes had been offered to entrants into the industry over short periods of relative scarcity. Those "gleaners of the coalfields," easily able to start operations in times of high prices, swelled the productive capacity and increased the personnel of the industry. In 1926 over 200 new pits and drifts were opened in Britain. But it was neither the numbers nor the output of those pits that was important, it was their potentiality for growth. Although there was undoubtedly a heavy infantile mortality among them, a significant proportion of them seemed to pay their way, and thus to struggle to maturity. If a small pit paid, it was not difficult to borrow capital, and so the infant grew up to increase the overcrowding.

The penalties of permanently shutting down were heavy. A pit had practically no scrap value. The capital sunk in its lay-out was irredeemable, machinery hardly paid for its removal, there was no property in patents, colliery housing was immobile, and there was seldom even any item for goodwill to be carried off from the wreck. A coal mine, with its specialised equipment, could not be converted into any other type of business. Even if the hard-pressed colliery owner succeeded in selling his pit as a "going concern," all that happened was that a new concern arose out of the ashes of the old, with reduced capital charges and losses written off, and went on dumping its output on an already surcharged market.

The opening of the new coalfields in South Yorkshire and Nottinghamshire, with their promised output of about 20,000,000 tons per annum, and the application of coal-cutting and conveying machinery to the industry, might solve the problem as far as particular units were concerned, but they aggravated it for the industry as a whole by further adding to its excess mine capacity. For the 20 years before the war the industry earned

"extraordinarily low" profits, and for the four years 1922—25 it earned, in real value, only a little over half its pre-war figure. The two things necessary were the elimination of the uneconomic producers and the increased efficiency of the remainder.

The ideal was so to set the stage that the unfits discovered themselves, and were thereafter automatically eliminated. At present competition in the coal industry was neither fair nor free. Dr. Bowie suggested, therefore, that the industry be required to adopt the usual practice of paying its different grades an irreducible money wage. That would mean that depression would be felt first by the weakest units, not as now broadcast throughout the whole industry, and falling with special weight on the young, modern and well-equipped pits.

Secondly, it was necessary to prevent the indiscriminate entrance of weak sellers into the industry. The mineral resources of the country should be administered with more regard to the interests of the nation and the industry, and less to that of the fortuitous owners of those resources. It could not be in the national interests that some 8000 independent persons should own the country's minerals, and that some collieries should have as many as over 50 royalty and wayleave owners to deal with.

The greatest possibilities of efficiency lay in the realm of industrial relations. The miner had for long been the doughtiest fighter in the industrial field, and the losses he had inflicted on himself, the industry and the community had been immense. As far as calculations could be made, it could be safely said that the miners, through industrial disputes since 1900, had lost in wages a sum which would have enabled them to buy up, lock, stock and barrel, the whole of the collieries of this country; in voluntary absenteeism they had during the same period lost another sum of equal amount; while the community had lost at least four times the total present-day capital value of the collieries. Output depended in the coal industry to an unusual degree on the workers' free will and choice. The problem was how to reduce the enormous wastes of industrial strife, of absenteeism, of a heavy labour turnover, and to give the worker a new incentive.

The unique wage agreement of 1921 was meant to deal with that, but was never at any time adequate to do it. Although its principles represented the most scientific method of wage adjustment yet evolved, and were likely to be more generally imitated in the future, they did nothing to provide that new interest in work which was the general need to-day. That could be best achieved at the pit where men met and worked together, and it must imply some relationship between the parties other than that of mere bargainners; it meant some degree of exchange of function. Control sharing, through pit committees, would by itself be no more adequate than works committees had been in industry in general; cash profit-sharing would merely introduce a fresh set of frictional contacts. The most promising solution would seem to lie in some form of ownership-sharing, freely introduced where conditions were suitable, and not, as advocated by the Samuel Commission, by any method of legal compulsion.

MONTREAL SECTION

The regular monthly meeting was held on November 16 at the Windsor Hotel, preceded by the usual dinner. About fifty members and guests were present to hear Mr. Charles O. Brown, consulting chemical engineer to the Nitrogen Engineering Corporation, give a highly interesting address on "Synthetic nitric acid." The Chairman of the Section, Dr. J. F. Snell, presided.

Mr. Brown described in great detail the manufacture of synthetic nitric acid according to the current American practice. The catalyst is platinum, and the temperature of the reaction is unique in that it is at least twice as high as in other similar reactions, *i.e.*, about 950–1000 °C. The raw materials are ammonia, water and air, and all grades of ammonia are equally suitable. The mixed gases, containing 10–11% of ammonia, are introduced into the converter, where the ammonia is converted into nitric oxide; they then pass into a cooler, after which the nitric oxide is oxidised to the dioxide. It is preferable to have all the nitric oxide oxidised before absorption is begun. The oxidation of nitric oxide to the peroxide is not reversible under 150 °C., and is one of the very few reactions whose rate is increased by a drop in temperature. Absorption takes place in chrome-alloy towers, generally arranged in series. Refrigeration is important, as a tower space of 3000 cb. ft. per daily ton may be reduced to 800 cb. ft. when ammonia refrigeration is used. In conclusion, the speaker compared the cost of nitric acid produced from Chile saltpetre and from synthetic ammonia, a comparison which seemed to favour the synthetic product.

In the discussion which followed the lecture, Dr. L. F. Goodwin made some comparison between the British and Continental practice and the American practice so well described by Mr. Brown. He also discussed the advantages and disadvantages of welded absorption towers as compared with riveted towers, both from the point of view of cost and of maintenance. Dr. H. Hibbert spoke of the possibilities of the process, with particular reference to Canadian conditions.

CALENDAR OF FORTHCOMING EVENTS

Dec. 16.—Society of Chemical Industry, *Birmingham and Midland Section*. Jointly with the Midland Section of the Institute of Chemistry. University Buildings, Edgbaston, Birmingham, at 6.30 p.m. "Recent work in the University biochemical laboratories," by Prof. A. R. Lang. The lecture will be followed by an inspection of the new laboratories.

Dec. 16.—Society of Chemical Industry, *Liverpool Section*. Joint meeting with the Chemical Engineering Group. The University, Liverpool, at 6 p.m. "Oil pollution of seas and harbours—and a remedy," by C. S. Garland. (*See Chem. and Ind.*, Dec. 9, p. 1152.)

Dec. 21.—Ramsay Chemical Dinner, held under the joint auspices of Society of Chemical Industry, Institute of Chemistry, Society of Dyers and Colourists, Glasgow University Alchemists' Club, Andersonian Chemical Society, Ardeer Chemical Club, and the Royal Philosophical Society of Glasgow, in the Trades House, Glassford Street, Glasgow, at 6 for 6.30 p.m. This year the Dinner has been subtitled "The Institute of Chemistry Jubilee," and the Chairman will be Prof. A. Smithells.

Jan. 2.—Society of Chemical Industry, *London Section*. Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "Future of biochemical research," by Dr. J. C. Drummond.

INSTITUTION OF CHEMICAL ENGINEERS

The Autumnal Conference opened on December 7 at Burlington House, Piccadilly. Sir Alex. Gibb, president of the Institution, occupied the chair, and Mr. Norman Swindon delivered a paper on "Submerged flame combustion."

After enumerating the conditions necessary for submerged flame combustion, the author gave a brief outline of the development of this subject from Collier's burner patented in 1887. During this portion of the paper the author dealt with certain difficulties which militated against success and emphasised the steps taken in modern design to eliminate these defects. The author then discussed in detail the effect of partial pressure on vapour produced, the lighting of the burner, the presence of sulphur in the fuel, and the importance of the intimate mixing of gas and air. The speed of flame propagation and its bearing on burner design was also touched upon as well as the mechanical means at present employed for apportioning the air and the fuel—a very important feature in the success of submerged flame combustion. Of equal importance, too, were the materials employed in the construction of such burners and the vessels in which these burners were placed, and a strong plea was raised for the development of materials, especially refractories, which could be used in the construction of these burners.

Passing to the employment of the submerged flame burner in chemical industry, the author divided its use into two sections, namely, for heating and for evaporation. He considered that whilst its usefulness as a steam generator for power purposes was limited, a large field would probably be available, especially in the chemical industry, for a burner of this type for heating or concentrating chemical solutions. The presence of the products of combustion in the vapour produced, whilst forming an efficient agitating device in some cases, is detrimental in others, and is obviated by the employment of a lead bath heated by the submerged flame and transmitting this heat to another chamber in which the liquid to be heated is contained, thus producing a vapour free from the products of combustion.

The burner could be easily employed in vessels constructed of fragile material, as the conditions under which it operated prevented local heating or high temperatures reaching the fragile wall of the container. After developing an entropy temperature chart for a steam-gas mixture, the author showed how such a chart was necessary in the determination of the efficiency of one of those boilers, and pointed out that in determining such an efficiency one had to take into consideration not only the calorific value of the fuel used, but also the heat and pressure energy stored in the fuel and in the air necessary for its combustion by the compression required to eject them into the burner. He stated that from his experience an efficiency of about 97% would be obtained with such a boiler.

The discussion was opened by Mr. J. Arthur Reavell, who agreed with the author in the unsuitability of such a boiler for generating steam for power purposes, but thought that in the chemical industry application for such a boiler could be found, and that in some applications its position would be unrivalled.

Dr. Ormandy referred to the amount of work that had been done on this subject by Mr. Brunler, and stated that still more work remained. Some of the work was being carried out in this country, and until the results were available he desired to retain an open mind on the efficiency of such a boiler.

Mr. Oscar Brunler pointed out that whilst the heating of a liquid by a submerged flame was a comparatively simple matter if the pressure on the surface of the liquid was at or about atmospheric, with higher pressures on this free surface the problem became much more complex and the difficulties of submerged combustion greatly increased.

Mr. Featherstone Hammond dealt with the very large area of the boundary surfaces between the liquid and the products of combustion thereby producing efficient cooling of the latter and the prevention of local heating.

Mr. Heastie raised several questions relating to heat transference, while Dr. Scholtz discussed the chemical effects which might arise when the burner is used, as was suggested, for the melting of metals either when too little air was present or when the air was more than sufficient for complete combustion.

In view of the statement in the paper that the heat developed in a submerged flame burner was many times greater per cb. ft. per hour than the heat developed in the new water-walled boiler furnaces, Prof. Holman asked it in consequence the submerged boiler was much lighter than the other types, and pointed out the great advantages that this would be in the cases where boiler plants were required in out-of-the-way places where transport became abnormal.

Prof. J. W. Hinchley also discussed the utility of the boiler as an evaporating and heating medium, and gave some interesting figures relating to heat transference across metal walls which had been subjected to different surface treatment as results of experiments carried out at the Imperial College of Science.

Mr. Bailey asked how small burners of this type could be made, as it seemed to him that cases would arise in which a number of small burners would be more suitable than some of the large burners which had been described by the author.

Mr. Featherstone Hammond, in replying to Mr. Bailey's question, said that burners had already been made which consumed about 60 cb. ft. of gas per hour, and that more specific information would have to be given before he could state if it were possible to go below this figure.

Sir Alex. Gibb, in proposing a vote of thanks, complimented the author on the clarity of the diagrams which he had shown, and stated that this was the first occasion in which an attempt had been made to discuss submerged-flame combustion in a sound analytical manner.

The Conference was resumed on December 8, when Mr. Macnab occupied the chair in the unavoidable absence of Mr. J. Arthur Reavell. Three papers dealing with refrigeration were presented.

In the first paper Mr. G. W. Daniells dealt with the design of refrigerating plants, and showed how the entropy temperature chart could be employed to determine the heat content of the refrigerant at various stages

in the cycle. On these charts was shown how expansion through a regulating valve carried out so that the total heat remains constant, affects the dryness of the liquid vapour mixture, and the effect of precooling the liquid refrigerant. Multiple effect compression was also discussed, and diagrams were shown of multi-pressure systems of working. The author pointed out that a successful refrigerant should not require excessively high pressures in the plant or a bulky compressor to handle it, but that it should be chemically inert to the materials employed in the construction of the compressor and chemically stable under operating conditions. These conditions limited the choice of refrigerants to such substances as ammonia, sulphur dioxide, methyl chloride, and one or two other hydrocarbons. The question of supercharging as a means of increasing the output of an existing plant was also treated. The latter portion of the paper dealt with heat transmission, and slides were projected illustrating types of coil heaters in which the flow of both refrigerant and the liquid being evolved was very poorly controlled, and showing how a very slight modification of such a design enabled much better control to be obtained in the coolers.

This paper was followed by another on the "Practical aspect of mechanical refrigeration as applied to chemical industry," by Mr. L. Chew. Dealing with compressor design, the author pointed out that the most notable change in the development of ammonia compressors consisted in raising the speed of rotation. Formerly the machines ran between 60 and 100 revolutions per minute, but now speeds varying from 300 r.p.m. for large machines to 500 r.p.m. for smaller machines are quite common. After discussing such factors in the design of ammonia compressors as effect of clearance, volumetric efficiency, coefficient of performance, ratios of compression, the author described modern compressor plant both of the high speed reciprocating and turbine types, and stated approximately the lowest capacity at which it was economical to instal the turbine compressor. Mention was made of a reciprocating machine upon the crank case of which could be fitted three different types of cylinders, thus permitting the machine first to operate through other refrigerating cycles; secondly, to deal economically with higher compression ratios, and, thirdly, to vary the refrigerating capacity. An interesting diagram was shown giving the relative sizes of turbo-compressors using different refrigerants but having the same capacity. In the latter portion of his paper Mr. Chew considered the vital question of heat transfer, and described a number of experiments which had been made to determine how the heat transmission coefficient was affected by different arrangements of coils and pipes. Reference was made to various forms of evaporators and condensers employed in refrigerating works, and the economic aspect of the subject was not forgotten.

On resumption of the meeting at eight o'clock, Mr. R. J. Mitchell gave his paper on "Electric automatic refrigerators for domestic use." The author dealt with the importance of refrigeration in the preservation of food-stuffs, and then considered the problem which faced the designer of a small machine for household use. In large plants the operation of refrigerating machines is

under the control of a skilled engineer, but household machines must be so constructed that they do not need expert or skilled supervision. The public expects to get a perfect machine of this type for about £50. A large amount of experimental work had therefore to be done before such machines could become a commercial proposition. Nearly all compression machines of this type used sulphur dioxide as the refrigerant since this material has a high latent heat, is not explosive, and when anhydrous does not attack the metal parts. Moreover, the cycle is a low pressure one and the material can be obtained in a pure state cheaply. The factors governing the design of the compressor are reliability and simplicity. For this purpose the reciprocating compressor is extensively employed. The automatic control of these household plants is also essential, and the author described a means whereby the motor driving the compressor and the supply of cooling water could be controlled by the temperature existing in the cold chamber. The construction of the cold chamber itself was also dealt with, the main features being the provision of an internal surface which could be readily cleaned, the insulation of that surface to prevent the ingress of heat to the contents of the chamber, and the provision of a door or doors of such a size that the contents of the chamber could be easily removed and which would fit in such a way as to inhibit the inflow of heat. Slides showing the general arrangement and details of several of those well-known machines were projected, and then the author proceeded to describe the principles upon which an adsorption machine works. After the description a number of diagrams were shown illustrating small refrigerators working on this system.

Mr. Willcocks, in opening the discussion, emphasised the necessity for the chemist to know something about refrigeration as well as for the engineer to know something about the chemical problems to which refrigeration could be applied. He mentioned the position of the refrigerating industry in America and how the problem of cooling an oil for the extraction of wax in which there had to be a temperature drop of 10° between the liquid being cooled and the cooling material at every stage in the cooling had been accomplished. Mr. Willcox also thought that the icebox formed a useful adjunct in the household preservation of food.

Dr. Seligmann mentioned some experiences which he had in connexion with the cooling of milk, and stated that in one form of evaporator he had obtained a very high coefficient of heat transfer at points where the film changed direction. He disagreed with the previous speaker on the subject of iceboxes, and contended that in such an apparatus whilst a temperature of 50° F. might be attained under suitable conditions a temperature of 56° F. was much more likely: 50° F., however, seemed to be a critical temperature, and in the milk industry the uniformity of temperature in an icebox was lacking. Other speakers referred to Mr. Mitchell's unbiassed descriptions of the machines which he had reviewed.

Mr. W. A. S. Calder, Vice-President of the Institution, occupied the chair at the first session on Friday, when Mr. W. J. Jones delivered his paper on "The problem of industrial lighting with some reference to chemical in-

dustry." The author pointed out that industrial lighting was a problem of great complexity since innumerable classes of work had to be considered. In such a problem visibility was an extremely important factor, and brought the experimenter face to face with the physiological problems of the eye. The brightness of an object, too, is dependent upon the amount of illumination allowed to fall on it and its reflectivity. The author then carried out some interesting experiments to show how the shape of an object seemed to be affected by various forms of lighting, and how the ability to perceive detail is dependent upon the intensity of illumination. The present method of replacing low candle power lamps by lamps of much higher candle power in reflectors, designed primarily for the former type of lamp, has negatived the greater illumination by the introduction of glare. The effect of glare was forcibly demonstrated by other experiments which the author made.

Proceeding from these technical points the author then considered the effect of lighting on production, and showed that, although tests of this nature were difficult to make, in every case where they had been made increase in lighting had resulted in increased output and better workmanship, and that this increase more than counterbalanced the additional expense entailed in lighting. The next question which naturally arose was the economics of light production. The cost of electric light depends upon the efficiency and price of the lamp and the price of electricity. The author showed that when these factors are taken into account, curves can be drawn showing minimum points at which lighting becomes most economical. The author also warned against increasing the life of a lamp by reduction of the voltage for by so doing the resultant light output is reduced to a very great extent. A chart was given to show the accident curve and the curve for the hours of artificial lighting over a period of one year. These possessed remarkable similarity, and certainly showed that these two factors were not independent.

Slides were shown illustrating the illumination of workshops and factories by putting modern high candle power lamps into old fittings and the glare which was produced thereby, and the same factories lit by high candle power lamps in fittings which had been designed for that purpose. The author both by his paper and his demonstrations clearly showed that the subject of factory lighting from the point of view of increased output, safety of operators, etc., was just as important as hygiene and ventilation, and amply repaid the extra cost which it involved.

An interesting discussion followed in which several speakers drew attention to the inadequate and antiquated methods of lighting which are adopted in some factories, and to the fact that the cleaning and attention to lights in factories is regarded as an unnecessary expense.

The first paper of the evening meeting, when Mr. H. J. Pooley occupied the chair, was by Messrs. Parker, Jackman and Vowler on "An apparatus for measuring the weight and volume of the contents of receptacles." The authors stated that they had been led to the development of this apparatus by the necessity of obtaining a simple and accurate method of weighing the charge

of goods to be cleaned and the solutions used for cleaning these goods in a laundry washing machine. Investigation of the problem led them to adopt a pressure cell formed of a metal casing provided with a thick rubber diaphragm and filled with glycerin. One or more of these cells were placed under the feet at one end of the washing machine and connected to a gauge graduated to read weights. The feet of the other end of the washing machine rest on knife edges, and provision is made for adjusting the pull exercised by the belts driving the machine. Flexible tubes connect the inlet and outlet pipes of the machine. The fluid employed to transmit the pressure from the cell to the gauge is glycerin, as it was found that this material was sufficiently viscous to damp down fluctuations set up at the reversal of the machine.

In the discussion Mr. F. H. Pooley asked several questions relating to the fluid used, the prevention of back lash in the gauge, etc.

The last paper was presented by Mr. A. J. Green on "The properties of silica and fireclay products in their relation to industrial usage." In his paper the author pointed out that fireclay is a comprehensive term embracing a variety of substances which differ considerably, both in constitution and physical properties. In the reduction of fireclay products, varying quantities of graded grog are worked into the clay to give homogeneous mixture, and after shaping the object is dried and fired according to a predetermined schedule. The next portion of the paper dealt with the texture of the fireclay products and the importance of grog in this respect. The constitution of silica products is determined in the main by the nature of the raw materials, the manufacturing procedure embodying the grading of the raw materials and the amount of flux used, and the control and extent of the firing operations. Under each of these headings considerable variation can occur, so that it will be evident that discrepancies in the resulting products are easily produced. Specific gravity, as a means of determining the grade of the product produced, was not an infallible test, since bricks of a specific gravity, varying from 2.32 to 2.37, a high grade article, contained varying quantities of tridymite and cristobalite, which play a conspicuous part in low-temperature spalling.

The next section of the paper dealt with the structural stability of silica and fireclay and refractories under load. Graphs were shown illustrating the behaviour of various specimens under loads of from 4 to 75 lb. per sq. in. when subjected to heat treatment. Naturally the behaviour of these materials under test depends upon the composition of the refractory, the firing treatment and its physical nature. After a consideration of the resistance to spalling of refractories, the author discussed their thermal properties and the temperature diffusivity and thermal conductivity of fireclay and silica products. It was pointed out that the temperature diffusivity of fireclay and silica products increases with temperature. The coefficient of diffusivity of both products is raised by increased firing treatment, and a high porosity is not hostile to low diffusivity. Under the heading of corrosion, erosion, and physico-chemical disintegration, the author discussed the

influence of iron compounds, the corrosion of silica bricks in the roof of an open-hearth steel furnace, and the influence of salty coals.

The paper was of a general nature, and covered such a wide field that very little time was left for discussion. Mr. Trost mentioned the development of an apparatus for testing firebrick and silica products under load, in which the readings were recorded automatically. In his opinion the standard laid down by the gas engineers of 50 lb. per sq. in. was excessive, a figure of 20 lb. per sq. in. being more suitable. Messrs. Hussey and Miers also spoke, but in view of the shortness of time available, they agreed together with other gentlemen to communicate their remarks in writing, and that these, together with the author's reply, would appear in the Transactions of the Institution.

BIOCHEMICAL SOCIETY

A meeting was held in the Imperial College of Science and Technology, on December 9, when the following papers were read:—

"The evaluation of yeast fat for vitamins A and D and of irradiated yeast fat for vitamin D," by E. M. Hume, I. Smedley-Maclean and H. Henderson Smith. Yeast fat was examined for its content of vitamin A and of vitamin D, the latter both before and after irradiation of the fat. A sample of total fat, derived from pressed brewer's yeast, showed no activity for vitamin A, when a daily dose of 0.18 g. was given to rats on a diet deficient only in vitamin A. A sample of acetone-soluble fat, prepared from yeast, which had been incubated in carbohydrate phosphate solution, was found neither to promote the growth nor the bone formation of rats on a diet deficient only in fat soluble vitamins, when a dose of 0.14 g. was given daily. It was, therefore, concluded that such a sample of yeast fat was devoid of vitamin D. Smedley-Maclean and Luce had previously found that a sample of total yeast fat, derived directly from pressed brewer's yeast, did promote growth and calcification of rats. The explanation of the discrepancy probably lay in the different kinds of yeast fat used, and the matter was being further investigated. The same two kinds of yeast fat, together with samples of fat prepared from yeast after a preliminary boiling with normal acid, were irradiated with the mercury vapour quartz lamp, and fed to rats on a diet deficient in fat-soluble vitamins, in very small daily doses. The best results were given by the acetone-soluble fat derived from incubated yeast, which promoted growth and bone formation in a daily dose of 0.005 mg. The quantitative relationship of the vitamin D in the irradiated fat to the two sterols, ergosterol and zymosterol, in the fat before irradiation are not yet worked out.

"Organic phosphates from rabbits' muscle," by J. Pryde and E. T. Waters. In confirmation of Embden and Zimmermann, hexose diphosphoric acid has been isolated as the brucine salt from muscle press juice prepared from rabbits, to which glycogen and sodium fluoride had been added. It has $[\alpha]_{5461}^{15} = -30.7^\circ$ in dry methyl alcohol, identical with that of the brucine hexose diphosphate formed during yeast fermentation. From 500 c.c. of juice obtained from the muscles of two medium-sized

rabbits 3.5 g. of the crystalline salt was obtained. In further confirmation of Embden and Zimmermann, when the fermentative resynthesis using added glycogen and fluoride is omitted a hexose monophosphoric acid only is obtained. 12 g. of the brucine salt was obtained from 5 kg. of muscle removed from 12 rabbits. In more recent work higher yields have been secured. The possibility has not been excluded that this monophosphate may consist of a mixture of two monophosphates. Adenylic acid, as reported by Embden and Zimmermann, has also been isolated from muscle pulp. From 12 rabbits approximately 1 g. was obtained. It has $[\alpha]_{5461}^{18} - 51.1^\circ$ in water, and m.p. 191° (decomp.). Heated at 100° in a sealed tube in anhydrous methyl alcohol containing 1% hydrogen chloride, it is decomposed with formation of a methyl pentoside free from phosphorus. From the hydrolysis products adenine was isolated as the picrate (m.p. 293° , with decomp.).

"Dephosphorylated methylhexosides derived from hexosediphosphoric acid," by W. T. J. Morgan and R. Robson. By the action of the bone phosphatase on the α - and β -methylhexosidediphosphoric acids both phosphoric acid groups have been removed and the corresponding α - and β -methylhexosides obtained as non-reducing syrups. The specific rotations, $[\alpha]_{\text{H}_2\text{O green}}^{20}$ $+ 60^\circ$ and $- 45^\circ$ respectively, showed that these compounds were not α - and β -methylfructosides. On hydrolysis with 0.01N HCl at room temperature both hexosides yielded a levorotatory sugar corresponding to $\alpha\beta$ -fructose. The ease of hydrolysis suggested that the compounds were α - and β -methyl- γ -fructosides, and the observed rotations are consistent with this view. Further evidence was obtained by converting the β -methylhexoside into tetramethyl- β -methylhexoside, $[\alpha]_{\text{H}_2\text{O green}}^{20} - 6.8$, which on acid hydrolysis yielded $\alpha\beta$ -tetramethylhexose, $[\alpha]_{\text{H}_2\text{O green}}^{20} + 30^\circ$. This specific rotation is close to that given by Irvine, Howarth, and others for $\alpha\beta$ -tetramethyl- γ -fructose, but differs widely from the value ($- 142^\circ$) for the corresponding derivative of normal (amylenic oxide) fructose. It is concluded that hexosediphosphoric acid is a derivative of γ -fructose. The existence of the unstable butylene oxide ring in conjunction with an unsubstituted reducing group makes it very probable that the second phosphoric acid group occupies position 6, and the following formula is therefore put forward as representing the structure of hexosediphosphoric acid:—

"Chemical changes taking place in muscular tissue when passing into rigor," by H. R. Hewer, H. Jairam and S. B. Schryver. Gelatin, if previously treated

with relatively dilute acids, yields a larger basic fraction (precipitable by phototungstic acid) of the hydrolysis products than does the untreated gelatin. Other animal proteins have been found to act in the same way. It is now shown that the muscular tissues of frogs, when in a state of rigor, yield on hydrolysis appreciably larger amounts of the basic fraction than do muscles in a state of rest.

"The relationship of pectin to hemicellulose," by E. J. Candlin and S. B. Schryver. The insoluble pectic acid, prepared from non-lignified cell wall substances of plants, readily undergoes decarboxylation on treatment with weak alkali at relatively low temperatures, to yield products similar in character to the hemicelluloses. Reasons are given for supposing that the pectins and hemicelluloses belong to a definite class of chemical compounds, for which the name polyuronide is suggested.

"Studies in the nutrition of birds," by Egerton Charles Grey. The resistance of Egyptian pigeons was found to vary with the breed, the black being more resistant than the white or brown. The wild pigeons are mostly black. These facts led to the choice of black pigeons for experiments, and a comparison of the tame and wild bird. The former were found to put on weight and lose weight rapidly, the latter slowly, which facts were correlated with the better development of the digestive system in the former and neuromuscular system in the latter. On a diet of polished rice the tame birds showed alimentary dystrophy, oedema, congestion, hemorrhage, death by general inanition or heart failure, but not neuritic symptoms; while the wild birds, which showed less of these symptoms, and which lived longer, developed convulsions and other neuritic symptoms. The brain was found not to lose weight. The nervous system is thus evidently only slowly involved, and only the hardy type will show the neuritic symptoms. These facts appear to have an obvious bearing on the aetiology of beri-beri. Early administration of cod-liver oil prepared the pigeon to resist the effects of a diet of polished rice, and certain nitrogenous substances, as well as radiation of the rice, appeared beneficial. Washing out the crop, and withholding food, act as a partial cure, while administration of sugar hastens death. Starvation does not therefore adequately account for the condition—rather, there is evidence of intoxication. One of the most remarkable changes in the body is the atrophy of the pancreas. It may diminish to a sixth of its weight and become almost liquid. When young pigeons are fed on whole rice they do not thrive; the organs are less developed, notably the pancreas. The facts indicate that the rice disease is due partly to the absence of the vitamin B complex and partly to the inadequacy of the rice as a diet. The vitamin B complex is considered as having two functions, firstly in catalysing the combustion of material in the tissues, whether of fat, carbohydrate, or protein origin; and secondly, in maintaining tissue tone. The various symptoms, it is claimed, can be interpreted in terms of the breakdown of one or both of these mechanisms.

"The estimation of chlorides on biological fluids," by R. K. Christy and W. Robson. A series of investigations on sodium chloride and water equilibria between

blood and tissues in laboratory animals necessitated a micro-method of estimating chlorides. Preliminary investigations, using the technique of the Volhard method, or its modifications, as well as that of the Van Slyke method, showed that from the point of view either of accuracy or of carrying out estimations by artificial light these methods were unsuitable for the purpose. The substitution of KIO_3 for KNO_3 in the KI-starch-nitrous acid method of Van Slyke did not yield accurate results. If, however, the bi-iodate $\text{KH}(\text{IO}_3)_2$ is used results are obtained within 1% of the true values. An additional advantage is that the end point is true over a wider range of p_{H} than that of the nitrous acid method, and does not require a buffered solution. It is applicable to fluids containing that quantity of HNO_3 usually added for the complete precipitation of chlorides by AgNO_3 . The reaction involved is $\text{KH}(\text{IO}_3)_2 + 10\text{KI} + 11\text{HNO}_3 \rightarrow 11\text{KNO}_3 + 6\text{H}_2\text{O} + 6\text{I}_2$.

SOCIETY OF GLASS TECHNOLOGY

The meetings at Stourbridge began on the evening of Tuesday, November 22 (when Prof. W. E. S. Turner gave a popular lecture on "Modern artistic glass"), and extended over Wednesday, November 23, when the following papers were presented:

"Modern artistic glass," by Prof. W. E. S. Turner. After referring to the properties which glass possessed as a medium for artistic expression, Prof. Turner stated that the two requisites for permanence in art were (1) beauty of form and (2) a knowledge of technique. With regard to form, this was exemplified in the high standards of later Egyptian, Roman, and Venetian glass. Elegance survived in a few modern factories, but it was not general. In decoration there was a wonderful field open to the glass craftsman. The question for the artist was how best to reconcile the treatment with the natural properties of the glass. Thus, enamelling, or even casing, might be carried too far, if it obscured entirely the transparency or translucence of the glass. The brilliance of cutting should have relation to the nature of the subject. Deep breaking or cutting of the surface might be bad artistically. Prof. Turner then gave a detailed study and review of artistic glassware in different countries. In America the man who had done most to develop artistic glass in the United States was an old friend of the Stourbridge neighbourhood, Frederick Carder, who was regarded as America's master glass maker. References were next made to modern glass production in Belgium, Austria, Germany, Czechoslovakia, and Sweden, as well as to two British firms, Messrs. James Powell & Sons (Whitefriars), Ltd., and to Messrs. John Moncrieff, Ltd., Perth (*Monart* ware). With regard to France, developments there had come through strength of personality. In no country had there been so marked a departure from the orthodox in form and decoration as in France.

The chairman, Mr. Walter Butterworth, senr., M.A. (President of the Society), commented on Prof. Turner's remarks so felicitously that he was invited to give a lecture himself, to deal more particularly with stained glass.

"Stourbridge fireclays and the manufacture of glass

house pots," by M. H. Edwards. According to local tradition the fireclay industry was introduced into the Stourbridge district about 1556, by some refugee Hungarian glass-workers, who found that the fireclays in the local coal measures were such as they needed for their melting pots. The bed of clay originally used was the Old Mine clay, which appears to have been first exploited in the Hungary Hill district. Later, other beds below this, the New Mine clays, were used, though none was so good as the Old Mine clay for glass house pots. The clays on being raised from the pit are tipped on the surface into separate banks for weathering, the time allowed being from 6 to 12 months, or longer. The pot clay is then broken, spread on a concrete floor in the open air and watered daily. When fit, it is conveyed to the mill, where it is ground and passed through a No. 12 mesh sieve. The grog used is lump for pot-clay, burnt to 1410°C . The important period of maturing follows. This consists of tempering and lying in bulk for from 4 to 6 weeks. Further tempering, usually by hand and foot, is necessary. In the construction of the pots the best method was that of "cross graining" the clay. A good pressure should always be exerted on the clay between the hands.

"Glass pot manufacture in Great Britain," by Prof. W. E. S. Turner. Six lengthy tables were presented, giving the results of a survey of the conditions of pot-making in this country. These tables dealt with: (1) General particulars concerning the pots; (2) the clay and its preparation; (3) the drying and storage of pots; (4) the treatment of pots in the arch; (5) conditions of pot use in relation to life; and (6) life of pots. The lecturer discussed the mass of details given in each table, the information for which was obtained as the result of a questionnaire circulated to representative firms in England and Scotland.

CANADIAN INDUSTRIAL NOTES

The Paispearl Products, Inc., of New York, the oldest and one of the largest manufacturers of artificial pearls in the world, has established a plant at Nanaimo, Vancouver Island, B.C. The product of the new industry will consist of pearl essence, known as "Essence d'Orient," which is extracted from fish scales by a chemical process. The essence will be shipped east to be converted into the so-called pearls. The company intends to handle all the fish-scales which the curing and canning establishments of the island produce.

It is intimated that the Laurentide Pulp & Paper Co., of Montreal, has acquired the properties of the Hawkesbury Lumber Co., W. C. Edwards Pulp & Lumber Co., and Pembroke Lumber Co. These large properties, on the Ottawa River and its tributaries, embrace one of the most extensive lumbering operations on the American continent. In financial circles it is considered to be a move to combat the continued expansion, in the Ottawa Valley, of the Canadian International Paper Co. The significance of this transaction can be comprehended in view of the prevalent report that the International Paper Co., along with the Backus interests, were negotiating a proposition whereby these concerns would control, to a large extent, the major portion of the pulp-wood of the province of Quebec.

CORRESPONDENCE

RESEARCH AT THE UNIVERSITIES

SIR.—I accept the statement in your recent article on "Research" that you wrote without "really reliable data to go upon." May I be allowed to supply you with the same? Students do not, as you suppose, conduct research. They work at problems which are part of the general scheme of research which is, at the moment, occupying the attention of the laboratories in which they work. They are guided in their training by members of staffs of the laboratories which include those of the Universities. The results of the research are usually submitted for publication in the joint names of the student and trainer, and are not published unless a competent body of chemists, acting as a publication committee, regard such a course as desirable. It is clear, therefore, that you cannot withhold your "highest opinion" from the research work of the student and confine it entirely to that of the University!

Perhaps you will tell us what you really mean in a future issue.

Yours faithfully,
JOCELYN THORPE

THE REMUNERATION OF CHEMISTS

SIR.—I think you have performed an excellent piece of work in opening your columns to correspondence on the subject of the salaries paid to chemists. Years ago I should have said that any form of "trades union" for chemists was the most iniquitous idea that could have been suggested, but to-day my views are very considerably modified. It seems scandalous to think that anyone who has taken a good degree in chemistry should be offered the miserable salary which so often is the case. For consider, Sir, what the acquirement of a good degree really entails. It means hard work for at least four years after school days are over, with all its attendant expenses, which have to be found somehow, then another year or so on learning how research is carried out (a total time very little different from that spent by the ordinary medical student), and then to be offered in many cases a "salary" less than that received by the typists in the office.

You, Sir, have published an advertisement for a chemist in to-day's issue of the JOURNAL, who in return for being a chemist, bacteriologist, "medicolegalist," organiser, lecturer, etc., is offered the princely salary of £400 per annum, with an efficiency bar later on. What would the B.M.A. say to a similar offer made to a member of that other profession? Firmly but surely they would "squash" the same and refuse to publish the advertisement. Surely it is time our Institute took similar action and did likewise, insisting that all firms employing chemists should pay them a real salary, not a mere pittance.

It is not that a chemist wants something for nothing, but at least he is entitled to a proper reward for the time and money expended in training himself, and to get this it seems to me that a really efficient organisation run on the lines of the B.M.A. is an absolute necessity. This means some scheme of registration with the non-acceptance of candidates who do not possess certain qualifications, and though such a scheme may seem

to bear hardly on what may be called the "fourth class" man, it would ensure a proper recognition of chemistry as a profession, corresponding with the legal and medical professions.

I am, Sir, etc.,

J. R. H. WHISTON

THE REGISTRATION COMMITTEE'S REPORT AND THE "B" QUALIFICATION

SIR.—Since the publication of this Report the Association has received numerous applications for membership as well as enquiries in regard to the Nomination Committee's requirements in the matter of the "B" qualification.

Having regard to the doubt which appears to exist as to the considerations governing the decision of the Nominations Committee, a fact which seems to have deterred some, probably qualified for full membership, from making application, we would repeat that the most careful consideration is given to every application. If the applicant satisfies the Committee regarding general and scientific education which, though generally does not necessarily include examination evidence, his case is decided strictly on its merits. Such applicants are asked to co-operate with the committee by supplying the fullest possible details, including particulars of any research work and processes devised or improved, since in this way the committee's work is simplified and expedited.

In general, it may be stated that there is no reason why the application of any candidate of proved competency should be rejected.

I am, Sir, etc.,

HENRY T. F. RHODES,
General Secretary.

British Association of Chemists

PERSONAL AND OTHER ITEMS

The Directors of Imperial Chemical Industries, Ltd., announce that M. Ernest John Solvay has been elected a member of the Board. M. Solvay is the son of M. Armand Solvay (Chairman of the well-known Belgian firm of Solvay et Cie) and grandson of M. Ernest Solvay, the inventor of the ammonia soda process and the founder of the firm of Solvay et Cie. It was through the co-operation of M. Ernest Solvay and Dr. Ludwig Mond that the ammonia soda process was introduced into England, and this led to the formation of Brunner Mond & Co., Ltd. Solvay et Cie have been represented on the board of Brunner Mond & Co., Ltd., for many years, and friendly relations have existed between the two companies since the commencement.

Lord Colwyn, president of the Institution of the Rubber Industry, opened the Institution's first public exhibition in the Central Hall, Westminster, on December 14.

Lord Brabourne and Dr. E. P. Andreae have joined the board of the Chemical and Metallurgical Corporation, Ltd.

Colonel J. T. C. Moore Brabazon, M.P., late Parliamentary Secretary to the Ministry of Transport, has joined the board of Kodak, Limited, the British subsidiary of the Eastman Kodak Company, of America.

Mr. F. Napier Sutton, F.I.C., Inspector under the Alkali etc. Works Regulation Act (Ministry of Health) for the Eastern and South Eastern Counties District, retires under the age limit on December 20. He joined the Department (then the Local Government Board) in April, 1885, as assistant to the then Chief Inspector, the late Mr. Alfred E. Fletcher, and was appointed Sub-Inspector in 1892 and Inspector in 1908, and thus completes a service of nearly 43 years.

The late Prof. A. Liversidge, F.R.S., Emeritus Professor of Chemistry in the University of Sydney, left £46,128, with net personalty £39,197. Amongst the bequests are: £1000 to Christ's College, Cambridge, for a scholarship, and £500 for a research lectureship in chemistry and in the English language; £1000 to the Royal School of Mines for a scholarship; £500 to the Chemical Society for a research lectureship in chemistry; £100 and his unpublished papers relating to chemical and scientific matters to the Chemical Society; and various bequests for the advancement of science in Sydney, New South Wales.

Home Office Industrial Museum

On December 3 the King and Queen visited the new Home Office Industrial Museum in Horseferry Road, Westminster, which has been established to demonstrate methods, arrangements, and appliances for promoting the safety, health and welfare of industrial workers. The spacious building which houses the exhibition was ready for occupation in 1914, but during the war and for a considerable time after 1918 it passed into the occupation of the military authorities. The restoration of the building to its original state and the organisation and collection of the exhibits began two years ago. Amongst the exhibits are lathes, drilling machines, grinding wheels, textile machinery, printing machines, laundry equipment and the like, and every machine has a lesson for employers and workers. Transmission machinery, power presses, baking machinery, rubber incorporating rolls, pottery processes, printing machinery, boilers and other steam plant are also installed. An important section is devoted to the chief industrial diseases; included in it are photographs showing methods for the prevention of lead poisoning, silicosis, and dermatitis in various industries. An anthrax section compares disinfected wools and untreated wools at various stages of the manufacturing process. The museum was opened to the public on December 5.

High-Frequency Electric Furnace for Steel Melting

Last week a demonstration was given of the Ajax-Northrup high-frequency furnace which has been installed by Edgar Allen & Co., Ltd., in their Imperial Steel Works, Sheffield, for melting steel. The furnace, which is the first of its kind to be used commercially in the manufacture of high quality tool steel, deals with about 450 lb. of steel an hour, whereas in the crucible process pots containing about 60 lb. of material are heated for 4 hrs. At the luncheon after the demonstration, Prof. C. H. Desch said the process provided a means of making high-class steel under strictly controlled conditions, without the slightest danger of contamination by foreign gases. The current consumption of the furnace was remarkably

low, because the heat was generated exactly where it was wanted, inside the metal and not outside.

Rubber Exhibition at Imperial Institute

The rubber exhibition, showing a wide range of exhibits, which was opened at the Imperial Institute, South Kensington, on December 2, was arranged by the governors of the Institute and the council of the Rubber Growers' Association. The exhibition provides a demonstration of the processes associated with the production and manufacture of rubber, and includes large models of rubber estates, and exhibits showing the uses of rubber in modern life and industry. Admission is free, and the exhibition will be open until December 31.

Ramsay Laboratory of Chemical Engineering

Several big industrial firms which have already obtained valuable recruits from the School of Chemical Engineering at University College, have just undertaken to provide a considerable portion of the money needed to carry on the work of the Ramsay Laboratory of Chemical Engineering for the next ten years. For the remainder of the endowment fund an appeal is being issued, and firms interested in the work of this department are being invited to promise annual subscriptions for the period of ten years. It is not intended to change the policy which has determined the work of the laboratory during the last few years, though it is hoped that sufficient funds will be available to allow certain extensions to be made to the buildings. The committee which has made itself responsible for raising the endowment fund is headed by Sir Alfred Mond, and has a number of other industrial leaders as members.

Reported Franco-German Chemical Agreement

Reports from Paris suggest that an agreement, in relation particularly to the exportation of dyestuffs, has been reached between the I.G. Farbenindustrie and the Kuhlman group and the Société Anonyme des Matières Colorantes in France. Official confirmation is not yet available, but it is reported that the French production quota is fixed at 15,000 metric tons, 10,000 t. for home consumption and 5000 for export.

The I.G. Farbenindustrie

The directors of the I.G. stated at a meeting last week that they propose to seek powers to issue convertible bonds (bearing not more than 6% p.a.) to the extent of 250 million marks (£12,500,000). The new capital will be required for construction and expansion in the coal-liquefaction and the nitrogen-fixation sections of the I.G. The board reports that business is satisfactory, and that it will propose, at the annual meeting on January 14, a dividend of 12% for 1927, compared with 10% in 1926. Progress has been made in coal liquefaction, and by the end of 1928 the production will amount to 200,000 tons of oil. No solution of the problem of the commercial production of synthetic rubber has been reached, but research is proceeding. An agreement is about to be concluded with the French chemical industry, but the negotiations with the British chemical industry have produced no tangible result. The chairman of the board stated emphatically that no agreements would be arrived at which were directed against the industries of other countries.

REVIEWS

THE DYEING OF TEXTILE FIBRES. By R. S. HORSFALL, M.Sc., and L. G. LAWRIE, A.I.C. Pp. x+416. London: Ernest Benn, Ltd., 1927. Price 28s.

"The Dyeing of Textile Fibres" is a welcome attempt to describe the many operations connected with the preparation, dyeing, and finishing of textiles. As the authors state in their short preface, the subject has been treated from the point of view of the material to be dyed, so that about half the book is occupied by consideration of the two most important fibres, cotton and wool. Smaller sections deal with artificial silk, natural silk and linen. In each case the structure and properties of the particular fibre are dealt with, followed by a description of the various treatments it may undergo preparatory to dyeing; next are described methods of dyeing with the different classes of dyestuffs suitable in each case and, finally, the process used in finishing.

The book is primarily intended for dyers who will find therein much valuable information connected with all phases of their art, including large numbers of dyeing recipes which illustrate the use of all the more important dyestuffs. The chemist engaged in the production of dyestuffs will be mainly interested in the stray comments to be found throughout the text which reflect the point of view of the authors towards himself and the fruit of his labours. On the whole, their attitude is at times critical, though much will be forgiven for the admission on page 18 that "The definite need for a dyestuff having certain properties will eventually result in its appearance."

The book is not illustrated, and, on the whole, this is not a serious defect, although occasionally one feels the need of a diagram or drawing to assist in the appreciation of certain of the pieces of machinery described.

The general lay-out and choice of type for chapter headings, sections and paragraphs are, perhaps, not entirely happy, so that at first the reader does not find his way about readily. There are several misprints, which will no doubt be corrected in a future edition; some are unimportant, but the passage on page 33 which talks of "the ratio of length to breadth of the cotton fabric being as high as 1/4000" needs revision.

In addition to the main sections dealing with practical matters connected with dyeing, there is also a short introductory chapter dealing with general points such as theories of dyeing and colour. This also includes a very brief historical survey of the development of synthetic dyestuffs (ending in 1909). The final chapters include notes on the laboratory testing of dyes, a subject that could hardly be adequately treated in the sixteen pages allotted to it. The statement in this section that the degree of fading is "roughly proportional to the amount of colour on the fibre" appears to need qualification in view of the results of modern research.

The authors' remarks on water-softening and the various protecting and dispersing agents used in dyeing will be of interest to many practical workers. No doubt also there may be many who will profit by the short notes on chemicals used in the dyeing industry and the sundry tables, although the necessity for their inclusion

in a book of this type appears doubtful to the reviewer. On the whole, this book is a valuable contribution to the literature of the art of dyeing, and should be read not only by dyers, but also by chemists—since, unfortunately, according to Messrs. Horsfall and Lawrie, this invidious distinction has still to be made.

J. E. G. HARRIS

ENZYMES. PROPERTIES, DISTRIBUTION, METHODS AND APPLICATIONS. By S. A. WAKSMAN, M.Sc., Ph.D., and W. C. DAVISON, M.A., M.D. Pp. xii + 364. London: Baillière, Tindall and Cox, 1926. Price 25s.

It is perhaps unfortunate that the time of publication of this work is so nearly coincident with the completion of the two volumes by Oppenheimer on "Die Fermente," and the abridged "Lehrbuch der Enzyme" of the same author. Comparison with the former is obviously unfair, but the present volume may be legitimately considered side by side with the "Lehrbuch." This being conceded, it has to be admitted that we cannot yet claim a book in the English language, on the important subject of enzymes, which is entirely satisfactory when compared with the best efforts of continental writers.

The book is divided into four unequal sections, the first of which deals with the properties of enzymes. This includes a brief historical survey of the subject, and an account of the rôle of enzymes in the living organism. Succeeding chapters deal adequately with the kinetics of enzymatic reactions and discuss in some detail the various factors which influence the course of such changes.

The second section is devoted to a detailed account of the distribution of enzymes in the human and animal body, in plants and in micro-organisms.

Section C, describing the methods of preparation and study of enzymes, is perhaps the most important in the book. The detail of this section is not, however, always complete: there is a lack of recent references in some cases, as in that of pectase, where statements of doubtful accuracy occur, based on a reference of no more recent date than 1894-5. On the other hand, omission of early fundamental work is sometimes noticeable: the work of Kjeldahl, on which the Lintner method of estimating diastatic power is based, is not mentioned. The chapter on oxidases is not very satisfactory, and one feels, here and elsewhere, that the authors are not quite satisfied with the arguments they defend.

The last section on the practical applications of enzymes is too short to permit of adequate treatment; the specialist in any one branch cannot expect to find detailed information. There is, for example, little more than a page devoted to brewing, and that containing a number of inaccuracies, especially with regard to temperatures.

Nevertheless, the authors have done some considerable service to English-speaking biochemists, particularly in that phase of their work which refers to original sources, the bibliography including over 1300 references.

The publishers have produced a good book, almost entirely free from misprints.

F. W. NORRIS

PARLIAMENTARY NEWS

Tin Ore Supplies

Capt. Hacking informed Sir N. Grattan-Doyle that he was aware that some authorities thought there would be a shortage of the tin ore supplies of the world; he was following closely the discussions which were taking place as to this, and also as to a possible stabilisation of world prices. He did not think that any advantage would be gained at present by the appointment of a special scientific committee to inquire, on behalf of the Government, into the possibilities of conserving the Empire's resources of tin. - November 28.

Home-grown Sugar

In a written reply to Sir J. Power, Mr. Guinness stated that 3,069,757 cwt of home-grown sugar beet was produced in the 1926-27 season. In the present 1927-28 campaign it is estimated that 4,780,000 cwt. will be produced. - November 28.

Foodstuffs (Preservatives)

Mr. Chamberlain informed Mr. Haslam that he had received representations from traders to the effect that since July 1 there had been greater losses on bacon and ham due to decomposition than normally occur, such losses being attributed to the Preservatives Regulations which recently came into force. Mr. Chamberlain stated that one of these representations related to Continental bacon, which had for many years been free from preservatives. The matter was being kept under observation, and he anticipated that these initial difficulties would quickly be overcome. - November 29.

Dead Sea Salts (Concession)

In reply to Colonel Howard-Bury, Mr. Ormsby-Gore said that four applications for the Dead Sea salts concession had been received, and it was decided, in principle, to grant a concession to Major Tulloch and Mr. Novomeysky, based on their offer, provided that suitable terms and conditions could be agreed upon with them, and that they furnished satisfactory financial guarantees. Negotiations on these points were still proceeding, and it was not possible, at present, to state what provisions the concession, if granted, would include. There was no proposal, however, that H.M. Government should obtain a controlling interest by the purchase of shares in the concessionary company. - Nov. 30.

Food and Drugs Acts

Replying to Dr. Vernon Davies, Mr. Chamberlain said he had no record of the number of inspections made or prosecutions undertaken under the Sale of Food and Drugs Acts. In 1924, 1925 and 1926, respectively, the number of samples analysed was 118,000, 118,930, and 120,617. During the same years the number of samples adulterated was 6987, 7714, and 7044, the percentage of samples adulterated for the same years respectively being 5.9, 6.5, and 5.8. - Dec. 1.

Water Pollution (Sugar Beet Factories)

In a written reply to Mr. Haslam, Mr. Guinness stated that the Department of Scientific and Industrial Research was carrying out, under the supervision of the Water Pollution Research Board, working scale experiments on the biological treatment of beet sugar factories' waste

waters at one of the largest factories in the United Kingdom, where facilities were being afforded by the Anglo-Scottish Beet Sugar Corporation. These experiments were being conducted by the staff of the Rothamsted Experimental Station, who also carried out successful preliminary investigation on which the experiments were based. The industry was maintaining close touch with these experiments through the medium of the committee referred to above, and was making a substantial contribution towards their cost. Considerable attention had been and was being devoted to the problem abroad, but no complete solution of the problem had yet been found. - Dec. 5.

Nauru and Ocean Islands (Phosphate Rock)

In answer to Major-General Sir Newton Moore, the Prime Minister said that numerous borings had been made to ascertain the amount of phosphate rock available at Nauru and Ocean Islands, and that it was estimated that these two islands contain together over 100,000,000 tons of phosphate of a quality containing from 85% to 88% tribasic phosphate of lime. Under the existing arrangements, the Governments of Great Britain, Australia and New Zealand were entitled to an allotment of the phosphate produced in each year in the following proportions:—

		United Kingdom Tons	Australia Tons	New Zealand Tons
1920	21	10,781	235,127	17,066
1921	22	10,178	171,881	38,706
1922	23		202,070	51,065
1923	24		318,690	60,687
1924	25		336,800	90,508
1925	26		274,183	98,160
1926	27		(say) 161,825	(say) 130,000
		32,062	2,014,480	190,002

cc. 5.

Blast Furnaces

In a written answer to Mr. Everard, Sir B. Chadwick said he had been informed by the National Federation of Iron and Steel Manufacturers that at the end of November last 160 furnaces were in blast, and 277 were damped down and idle, whereas at the end of November, 1924, 173 were in blast and 302 damped down and idle. - Dec. 7.

COMPANY NEWS

LEEDS FIRECLAY CO., LTD.

The report for the year ended June 30, 1927, shows profits amounting to £42,887 (against £50,209 for the previous year), plus £7155 brought forward. After deducting debenture and loan interest there was a balance of £39,229, from which the directors recommend the payment of a dividend of 8% on the preference shares (against 7½%), 6% on the ordinary shares (against 5½%), and the transfer of £1864 to reserve fund (making that fund £130,000), leaving £7364 to be carried forward.

NON-INFLAMMABLE FILM CO., LTD.

This company has purchased from the War Office a large factory at Lancaster comprising about 34 acres, situated on the banks of the River Lune. The water supply is practically unlimited and of a quality entirely suitable for processes, and railway sidings connected with the London Midland & Scottish Railway run into the factory. Since the purchase was made plans for

development on a considerable scale have been completed, large orders for machinery have been placed, and the equipment of the works is being undertaken with all speed.

CELANESE CORPORATION OF AMERICA

The directors have declared a regular semi annual dividend of $3\frac{1}{2}\%$ on the 7 cumulative first participating preferred stock. This makes dividends, including arrears, paid and declared to be and stock during 1927 amounting to $19\frac{1}{4}\%$.

BRUNNER INVESTMENT TRUST

This Trust has been registered as a public company with a nominal capital of £500,000 in £10 shares. The objects are to acquire and hold shares, debentures, scrip and securities, to act as trustees, etc. The directors are Sir John F. Brunner (director of Madeley Collieries); Mr. R. L. Benson (director of Robert Benson & Co.) and Mr. F. J. M. Brunner (director of Madeley Collieries). The registered office is at 24, Old Broad Street, E.C.2

ALUMINIUM CORPORATION, LTD.

The report for the year 1926 shows a profit of £36,224, compared with £53,743 for 1925. After providing for debenture loan and mortgage interest there was a deficit of £62,163, which, with the balance of £13,731 brought forward, gives a debit balance of £76,347 to be carried forward.

INTERNATIONAL ARTIFICIAL SILK CO., LTD.

This company has been formed with a capital of £660,000, divided into 2,640,000 shares of 5s. each, to acquire from La Soie de Compiègne two large modern mills in France erected for the manufacture of viscose silk, and to provide capital sufficient to increase the present production of three quarters of a ton per day to 4 tons per day during the next 12 months. The chairman is Mr. Andrew Clark, lately managing director of the Clyde Paper Co., Ltd., and the directors are Comte Jean de Nicolay, president of La Soie de Compiègne; Mr. F. R. A. Shortis, lately vice-president of the Guaranty Trust Company, of New York; Lt.-Col. R. Woodruff Cox, managing director of Cox & Edwards, Ltd.; Mr. J. W. Lomax, chairman of the Irwell Bank Spinning Co. (1919), Ltd., and director of Laly Mills (1919), Ltd., and the Manchester Cotton Association; Mr. G. Blay, chairman of Cannon Hill Estates, Ltd.; and Mr. A. N. Harper. The technical consultants are Messrs. Sindall & Bacon and Mr. H. Jentgen.

ELECTROLYTIC ZINC CO., LTD.

The annual meeting was held, in Melbourne, on October 25, at which Mr. W. H. Baillieu, who presided, said that the outstanding events of the past year were the increased efficiency of the operation of the company's undertakings and the developments of the Tasmanian West Coast mines. The decline in base-metal prices was largely offset by the lower prices payable for concentrates in accordance with the sliding-scale agreement, by higher recoveries and lower working costs. The ore reserves in the West Coast mines totalled 1,400,000 tons. An economic method of treating the ores had been evolved, resulting in the establishment of a commercial unit. The gain of over 2000 tons output of zinc was a tribute to the efficiency of the company's technical staff.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

- Acid Acetic, 40% tech.—£19 per ton.
 - Acid Boric, Commercial.—Cryst., £30 per ton; Powder, £32 per ton; Extra fine Powder, £34 per ton.
 - Acid Hydrochloric.—3s. 9d.—4s. per carboy d/d., according to purity, strength and locality.
 - Acid Nitric 80% Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 - Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 - Ammonia Alkal.—£6 15s. per ton f.o.r. Special terms for contracts.
 - Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 - Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 - Borax, Commercial. Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 - Calcium Chloride, Solid.—£5 £5 5s. per ton, carr. paid.
 - Copper Sulphate. £25—£25 10s. per ton.
 - Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 6½ O.P. 1d. extra in all cases. Prices according to quantity.
 - Nickel Sulphate. £38 per ton d/d.
 - Nickel Ammon. Sulphate. £38 per ton d/d.
 - Potash, Caustic. £30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex wharf. Lond. in cwt. kegs.
 - Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 - Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 - Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots, £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 - Soda Crystals. £5—£5 5s. per ton ex railway depots or ports.
 - Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 - Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 - Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 - Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.
- #### RUBBER CHEMICALS
- Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 - Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 - Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 - Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 - Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 - Carbon Black.—5½d. per lb., ex wharf.
 - Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 - Chromium Oxide, Green.—1s. 1d. per lb.
 - Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron".—£13 12s. 6d. per ton, f.o.r.
 London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur
 Precip. B.P.—£47 10s.—£50 per ton, according to
 quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to
 quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £10 5s. per ton. Good demand.
 Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality.
 Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent,
 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carboic.—Crystals.—7½d.—7¾d. per lb. Crude 60's,
 2s. 5d. per gal. prompt; lower for 1928 delivery.
 Acid Cresylic, 99/100.—2s. 11d.—3s. per gal. 97/99.—2s. 4d.
 —2s. 8d. per gal. Pale, 95%, 2s. 3d.—2s. 6d. per gal.
 Dark, 95%, 2s. 1d.—2s. 3d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per
 ton; Anthracene Oil.—Strained, 8d.—8½d. per gal.
 Unstrained, 7¾d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9¾d. per gal., ex works in
 tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal.,
 ex works in tank wagons; Pure, 1s. 5d.—1s. 6d. per gal.,
 ex works in tank wagons.
 Toluene.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 6d.—
 2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.
 Creosote.—Cresylic 20/24%,—10d.—11d. per gal. Middle Oil,
 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard
 specification, 7½d.—7¾d. per gal. ex works. Salty, 7d.
 per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.
 —10d. per gal. Solvent 95/160, 1s. 3d.—1s. 4d. per
 gal. Solvent 90/190, 9½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton.
 Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £13—£13 10s. per ton. Flaked,
 £14—£15 per ton.
 Pitch, medium soft.—85s.—90s. per ton, f.o.b. according
 to district. Market firm.
 Pyridine.—90/140.—5s. 6d.—6s. 6d. per gal. 90/180.—3s. 6d.—
 5s. per gal. Heavy.—3s.—3s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices
 include packages except where otherwise stated.

Acid Gamma.—4s. 6d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winthor.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—8d. per lb., naked at works.
 Aniline Salts.—8d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb., 100%.
 Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 20/31° C.—5½d. per lb.
 m-Cresol 98/100%.—2s. 3d.—2s. 5d. per lb.
 p-Cresol 32/34° C.—2s. 3d.—2s. 5d. per lb.
 Dichloraniline.—1s. 10d. per lb.
 Dimethylaniline.—1s. 11d. per lb.
 Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—2s. per lb. d/d.
 β-Naphthol.—10d. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb.
 β-Naphthylamine.—3s. per lb.
 o-Nitraniline.—5s. 9d. per lb.
 m-Nitraniline.—3s. per lb. d/d.
 p-Nitraniline.—1s. 8d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb.
 R. Salt.—2s. 2d. per lb.
 Sodium Naphthionate.—1s. 8½d. per lb., 100% basis d/d.
 o-Toluidine.—8½d. per lb.
 p-Toluidine.—2s. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in
 glass containers.
 Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product,
 according to quantity. Solely ex Gum.—1s.—1s. 3d. per
 oz., according to quantity.
 Acid, Boric B.P. Cryst. 36s.—39s. per cwt. Powder
 40s.—43s. per cwt.; Extra Fine Powder, 42s. per cwt.,
 according to quantity. Carriage paid any station in
 Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 6½d.—1s. 7d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d.
 per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 4½d. per lb. Tech-
 nical 11½d.—11¾d. per lb.
 Acid, Tannic, B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Acetanilide.—1s. 6d.—1s. 9d. per lb. for quantity.
 Amidol.—7s. 6d.—9s. per lb. d/d.
 Amidopyrin.—8s.—8s. 3d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 5d. per lb., according to
 quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton. Powder £39
 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—9s. per oz.
 Barbitone.—5s. 9d.—6s. per lb.
 Benzophenol.—3s. 3d. per lb.
 Bismuth Carbonate.—10s. 4d.—10s. 7d. per lb. Bismuth
 Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—
 9s. 10s.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—
 8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb.
 Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Sub-
 chloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.
 —8s. 1d.—8s. 4d. per lb. Extra and reduced prices for
 smaller and larger quantities respectively; Liquor
 Bismuthi et Ammon. Cit. B.P. in W. Qts.—1s. 1d. per lb.;
 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—Crystal 25s. per cwt. Powder 26s. per cwt.,
 according to quantity, carr. paid any station in Great
 Britain in ton lots.
 Bromides.—Ammonium.—1s. 11½d.—2s. 3d. per lb.

Potassium.—1s. 8½d.—1s. 11½d. per lb. Sodium.—1s. 10½d.—2s. 2d. per lb. Granulated ½d. per lb. less. All spot. Large quantities at lower rates.

Calcium Lactate B.P.—1s. 2d.—1s. 3½d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.)—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s. 3d. per gal.; 20 vols., 3s. 4d. per gal.

Hydroquinone.—3s. 10d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 6d. per lb.

Iron Perchloride.—18s.—20s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 15s. 6d. January delivery per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.

Methyl Salicylate.—1s. 5d.—1s. 9d. per lb.

Methyl Sulphonat.—9s.—9s. 3d. per lb.

Metol.—9s.—11s. 6d. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb. Less in quantity.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate.—90/100% (Cream of Tartar) 96s. per cwt., less 2½%.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—5½d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.

Resorcin.—2s. 10d.—3s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—1s. 11d.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—10s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.

Sod. Salicylate.—Powder, 1s. 7d.—1s. 9d. per lb. Crystal, 1s. 8d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.

Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.

Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.

Sulphonat.—6s. 9d.—7s. per lb.

Tartar Emetic B.P. cryst. or powder.—2s.—2s. 1d. per lb.

Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.

Aubepine (ex Anethole).—11s. per lb.

Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.

Anethole (M.P. 21/22° C.).—5s. 6d. per lb.

Benzyl Acetate from Chlorine-free Benzyl Alcohol—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb. Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.

Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.

Coumarin.—10s. per lb.

Citronellol.—13s. 3d. per lb.

Citral.—8s. 3d. per lb.

Ethyl Cinnamate.—6s. per lb.

Ethyl Phthalate.—3s. per lb.

Eugenol.—8s. 3d. per lb. Geraniol (Palmarosa).—17s. 9d. per lb. Geraniol.—6s.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. per lb. Linalol.—(ex Bois de Rose) 14s. per lb.—(ex Shui Oil) 9s. 9d. per lb. Linalyl Acetate.—(ex Bois de Rose) 17s. 6d. per lb.—(ex Shui Oil) 13s. 9d. per lb.

Methyl Anthranilate.—8s. 6d. per lb.

Methyl Benzoate.—4s. per lb.

Musk Ketone.—35s. per lb.

Musk Xylol.—8s. per lb.

Nerolin.—4s. 6d. per lb.

Phenyl Ethyl Acetate.—12s. per lb.

Phenyl Ethyl Alcohol.—10s. 6d. per lb.

Rhodinol.—31s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—15s. 3d.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb. Bergamot.—26s. per lb. Bourbon Geranium.—13s. per lb.

Camphor.—9d. per lb. Cananga, Java, 15s. 9d. per lb. Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 9d. per lb., e.i.f. U.K. port, for shipment over 1928; Ceylon, Pure, 1s. 7d. per lb. Clove, pure 5s. per lb.

Eucalyptus, Australian—2s. 1d. per lb. Lavender.—Mont Blanc, 38/40%, 17s. per lb. Lemon.—8s. 6d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. 3d. per lb. Peppermint.—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Feb. 6th, 1928. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Dec. 22nd, 1927. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Akt. Svenska Flaktfabriken. Increasing capacity of drying installations. 32,021. Nov. 28. (Swed., 29.11.26.)

Bloxam (Geigy A.-G.). Manufacture of emulsifying agents. 32,427. Dec. 1.

Cooper, Mason, and Cooper & Co. Grinding etc. mill. 32,669. Dec. 3.

Frischer. Apparatus for treating solutions. 32,440. Dec. 1. (Ger., 6.12.26.)

General Electric Co., Ltd., and Middleton. Purification of precipitates etc. 32,130. Nov. 29.

Jaubert. Colloidal diaphragms. 32,228. Nov. 30. (Fr., 1.12.26.)

Johnson (I.-G. Farbenind.). Carrying out high-pressure etc. reactions. 32,551. Dec. 2.

Newell, and Newell & Co., Ltd. Rotary kilns. 31,939. Nov. 28.

Pickard. Filters. 32,539. Dec. 2.

• Prétot and Ullmann. Removal of solids from gases. 31,961. Nov. 28. (Fr., 4.12.26.)

Raabe. Leaching etc. materials. 32,377. Dec. 1.

Soc. L'Air Liquide. Separating etc. constituents of gaseous mixtures. 32,289. Nov. 30. (Fr., 4.12.26.)

I.—Complete Specifications

13,642 (1926). Whatmough. Apparatus for dispersing solids in liquids. (280,973.)

20,723 (1926). Schucany. Regenerative gas-fired furnaces. (281,002.)

26,487 (1926). Dorey. Grinding-mills. (281,062.)

2086 (1927). Marks (A.C. Spark Plug Co.). Filters. (281,124.)

*12,124 (1927). I.-G. Farbenind. Manufacture of catalysts. (281,218.)

*31,555 (1927). Studenges. f. Gasind. Adsorption and drying of gases. (281,305.)

*32,021 (1927). Akt Svenska Flaktfabriken. Increasing the capacity of drying installations. (281,339.)

II.—Applications

Allgem. Ges. f. Chem. Industrie. Treatment of hydrocarbons. 32,010. Nov. 28. (Ger., 26.11.26.)

Broughton and Hadlington. Gas producers. 32,691. Dec. 3.

Cooke. Distillation of coal etc. 32,502. Dec. 2.

Gordon, and Imperial Chemical Industries, Ltd. Hydrogenation of carbonaceous materials. 32,543. Dec. 2.

Griven. Treating fuel for internal-combustion engines. 32,542. Dec. 2. (Latvia, 4.12.26.)

Humphrey, and Imperial Chemical Industries. Hydrogenation of carbonaceous materials. 32,237. Nov. 30.

Recovery of oils from carbonaceous materials. 32,238. Nov. 30.

Low-temperature distillation of carbonaceous materials. 32,239. Nov. 30.

Johnson (I.-G. Farbenind.). Production of products analogous to montan wax. 32,685 and 32,686. Dec. 3.

Johnson (I.-G. Farbenind.). 32,548. See VII.

Kelly. Treating oils etc. 31,999. Nov. 28.

Marks (Bernitz Furnace Appliance Co.). Gas generator. 32,505. Dec. 2.

Misch. Apparatus for producing gas. 31,990. Nov. 28.

Pehrson, Pehrson, and Wheeler. Carbonisation of coal. 32,599. Dec. 2.

Sachanen and Tihtscheyew. Cracking petroleum products. 32,566. Dec. 2.

Soc. Anon. La Carbonite. 31,965. See III.

II.—Complete Specifications

32,248 (1926). Nielsen and Laing. Manufacture of gas. (281,105.)

32,862 (1926). Gaertner. Distilling or coking coal. (281,110.)

*14,325 (1927). Koppers Co. Coking retort ovens. (281,221.)

*20,030 (1927). Bates. Hydrogenation of coal. (281,240.)

*29,307 (1927). I.-G. Farbenind. Manufacture of motor fuels. (281,247.)

*31,290 (1927). Ges. f. Linde's Eismaschinen. See VII.

*31,910 (1927). Friedlaender & Co. Preparing and briquetting non-caking fuels. (281,326.)

*32,010 (1927). Allgem. Ges. f. Chem. Industrie. Treatment of hydrocarbons with liquid sulphur dioxide. (281,337.)

III.—Applications

Barrett Co. Distillation of tar etc. 31,951. Nov. 28. (U.S.A., 14.12.26.)

Hübsch and Karpati. Removal of phenols from tars etc. 32,029. Nov. 28. (Hung., 15.1.27.)

Soc. Anon. La Carbonite. Separating-apparatus for tar etc. 31,965. Nov. 28. (Fr., 2.12.26.)

III.—Complete Specification

*31,501 (1927). I.-G. Farbenind. Manufacture of aromatic hydrocarbons. (281,298.)

IV.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of azo dye-stuffs. 32,653. Dec. 2.

I.-G. Farbenind. Production of alkylpyrazolanthrones. 32,684. Dec. 3. (Ger., 14.12.26.)

Johnson (I.-G. Farbenind.). Production of derivatives of phthalic acid. 31,966. Nov. 28.

Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. 32,679. Dec. 3. (Switz., 4.12.26.)

IV.—Complete Specifications

20,992 (1926). British Alizarine Co., Ltd. Dawson, and Beghin. Production of dyestuffs from benzanthrone. (281,016.)

379 and 26,380 (1927). Barnard, and British Alizarine Co., Ltd. Manufacture of dyestuffs and dyeing cellulose esters. (281,114 and 281,213.)

*30,058 (1927). I.-G. Farbenind. Manufacture of hydrogenated naphtho-styriols. (281,257.)

*30,948 (1927). Bensa. Manufacturing chloroperylene quinones. (281,281.)

*31,393 (1927). I.-G. Farbenind. Manufacture of phenylthioglycolic acids. (281,290.)

*31,393 (1927). I.-G. Farbenind. Manufacture of phenylthioglycolic acids. (281,290.)

V.—Applications

British Celanese, Ltd., and Ellis. Treatment of materials containing cellulose derivatives. 31,935. Nov. 28.

British Celanese, Ltd., Ellis, and Olpin. Treatment of cellulose derivatives. 31,936. Nov. 28.

British Vegetable Parchment Mills, and Harrison. Vegetable parchment. 32,643. Dec. 3.

Chem. Fabr. Pott & Co., Pott, and Sapitz. Production of viscose. 32,308. Nov. 30. (Ger., 30.11.26.)

Dreyfus. Treatment of cellulose derivatives. 32,249 and 32,250. Nov. 30.

Eschungen. 32,143. See XI.

Herninghaus & Co., and Wenz. Treating cellulose-containing materials. 32,445. Dec. 1. (Ger., 1.12.26.)

Kuppel. Manufacture of impermeable paper. 32,002. Nov. 28. (Fr., 2.12.26.)

Lucas, and Vickers, Ltd. Manufacture of cellulose. 32,112. Nov. 29. Treatment of vegetable matters. 32,113. Nov. 29.

Marx. Manufacture of paper. 32,459. Dec. 1.

V.—Complete Specifications

18,722-3 (1926). British Celanese, Ltd., and Ellis. Treatment of fabrics. (280,989-90.)

25,280 (1926). Courtaulds, Ltd., Wood, and Turney. Manufacture of artificial silk. (281,058.)

966 (1927). British Dyestuffs Corp., Ltd., and Hailwood. Manufacture of artificial textile fibres. (281,117.)

*31,704 (1927). Seutan Co. Proofed paper. (281,316.)

VI.—Applications

Baechler, Kiser et Cie. Vertical dyeing-apparatus. 32,145. Nov. 29. (Fr., 4.12.26.)

Durand et Huguenin Soc. Anon. Production of printings etc. by vat dyestuffs. 32,010. Nov. 28. (Ger., 26.11.26.)

Imray (I.-G. Farbenind.). Dyeing pelts etc. 32,265 and 32,266. Nov. 30.

Soc. Chem. Ind. in Basle. Production of fast tints on cellulose esters etc. 32,568. Dec. 2. (Switz., 4.12.26.)

Sykes and Sykes & Sons, Ltd. Dyeing-machines. 32,340 Dec. 1.

VI.—Complete Specifications

16,270 (1926). Jones, Kilby, and Standfast Dyers and Printers, Ltd. Dyeing. (280,983.)

26,631 (1926). Durand and Huguenin Soc. Anon. Manufacture of products for dyeing or printing. (260,303.)

379 and 26,380 (1927). Barnard, and British Alizarine Co., Ltd. See IV.

*32,009 (1927). Durand and Huguenin Soc. Anon. Producing dyeings and printings by means of vat dyestuffs (281,336.)

VII.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of nitrates. 32,415. Dec. 1.

Frischer. Concentration of nitric acid. 32,430 Dec. 10 (Ger., 6.12.26.)

I.-G. Farbenind. Production of carbon disulphide. 32,705. Dec. 3. (Ger., 13.12.26.)

Johnson (I.-G. Farbenind.). Production of hydrogen etc. 32,548. Dec. 2. Liquefying oxides of nitrogen. 32,549. Dec. 2. Production of potassium compounds. 32,687. Dec. 3. Eliminating oxygen from gases. 32,688. Dec. 3. Production of cobalt carbonyl. 32,689. Dec. 3

VII.—Complete Specifications

22,576 (1926). Wallace and Gregor. Recovery of soda from solutions. (281,035.)

3946 (1927). Blythe & Co., Bentley, and Cutlow. Purifying sulphur containing bitumen. (281,133.)

7541 and 8300 (1927). Holzverkohlungs-Ind. A.-G. See XX.

14,056 (1927). Frischer. Producing volatile inorganic acids. (271,881.)

*31,290 (1927). Ges. f. Lande's Eismaschinen. Extracting ammonia from gases. (281,288.)

VIII.—Applications

British Thomson-Houston Co., Ltd. Manufacture of abrasive materials. 32,673. Dec. 3. (U.S.A., 3.12.26.)

Lucas. Treatment of articles of burnt clay etc. 32,018. Nov. 28.

VIII.—Complete Specifications

*29,447 (1927). Patent-Treuhand-Ges. Producing a fluid deformable ceramic fused product. (281,249.)

*29,855 (1927). Setterberg. Manufacturing porous refractory bricks. (281,254.)

IX.—Applications

I. G. Farbenind. Manufacture of cementing-compositions. 32,428. Dec. 1. (Ger., 1.12.26.)

Jensen. Rotary cement-burning kilns. 31,970. Nov. 28.

Ratcliffe and Stewart. Manufacture of bricks etc. 32,137. Nov. 29.

IX.—Complete Specifications

21,160 (1926). Doggett. Waterproofing-materials and concrete articles treated therewith. (281,022.)

*29,042 (1927). Rostock. Impregnating and coating surfaces of concrete etc. (281,241.)

X.—Applications

Atkinson and Brearley. Manufacture of stainless iron. 32,189. Nov. 30.

Broken Hill Proprietary Co., Lewis, and Power. Blast furnaces. 32,375. Dec. 1. (Austral., 9.12.26.)

Coles. Rendering iron etc. rustless. 32,048. Nov. 29.

Coles. Sherardizing. 32,620. Dec. 2.

Deuts. Gold- u. Silber-Scheideanstalt, and Schoenbeck. Manufacture of amalgams. 32,167. Nov. 29.

Duffield. Reduction of ores. 32,020. Nov. 28. (U.S.A., 29.11.26.)

Johnson (I.-G. Farbenind.). Production of iron powder. 32,552. Dec. 2.

Talbot. Metallurgical furnaces. 32,564. Dec. 2. (Belg., 30.6.27.)

Wade (Treiberies et Laminiers du Havre). Manufacture of metallic powders. 32,677. Dec. 3.

X.—Complete Specifications

15,591 (1926). Johnson (I.-G. Farbenind.) Reduction of iron ores. (280,976.)

24,591 (1926). Wade (International Nickel Co.). Manufacture of alloys. (281,051.)

3016 (1927). Coley. Manufacture of zinc. (281,129.)

1754 (1927). Jackson (Siemens & Halske A.-G.). Electro-depositing chromium. (266,379.)

7594 (1927). General Motors Corp. Electrolytic deposition of chromium. (273,659.)

9441 (1927). Gustafsson. Producing metals from oxide ores. (269,179.)

16,876 (1927). Metals Protection Corp. Chromium plating. (277,295.)

19,293 (1927). Appel. Electrolytic separation of chromium. (274,882.)

*32,020 (1927). Duffield. Roasting and reduction of ores. (281,338.)

XI.—Applications

Almida Accumulators, Ltd. and Levy. Electric cells. 32,023. Nov. 28.

Campbell and General Electric Co. Manufacture of photo-electric cells. 32,409. Dec. 1.

Eschingen. Increasing electric resistance of films of cellulose esters etc. 32,143. Nov. 29. (Aust., 1.12.26.)

Schmid. Galvanic cells. 32,543. Dec. 1. (Ger., 2.12.26.)

Soc. Franç. des Lampes à Incandescence Luxor. Filaments for incandescent lamps. 32,379. Dec. 1. (Fr., 1.12.26.)

Willeox. Electric induction furnaces. 32,322. Nov. 30.

XI.—Complete Specifications

21,028 (1926). Lewis. Galvanic batteries. (281,018.)

3162 (1927). Sherrin. Secondary batteries. (281,130.)

3227 (1927). Pechkranz. Electrodes for electrolytic cells. (265,606.)

4754 (1927). Jackson (Siemens & Halske A.-G.). See X.

7594 (1927). General Motors Corp. See X.

16,876 (1927). Metals Protection Corp. See X.

19,293 (1927). Appel. See X.

XII.—Application

Bloxam (Geigy A.-G.). 32,427. See I.

XII.—Complete Specifications

13,138 (1926). Billingham. Emulsification of vegetable and animal oils, fats, etc. (280,762.)

18,194 (1926). Downs and Bellwood. Extraction of oil from the pericarp of palm fruit and like nuts. (280,986.)

*26,573 (1927). Böhme A.-G. Treatment of fats and oils. (281,232.)

XIII.—Applications

Eschingen. 32,143. See XI.

Grindley & Co., and Yeates. Synthetic resins. 32,301. Nov. 30.

Ruppel, and Usines de la Basse-Meuse. Obtaining coloured coatings. 32,000. Nov. 28.

XIII.—Complete Specification

*31,655 (1927). I.-G. Farbenind. Preparing surfaces for the reception of cellulose lacquers. (281,310.)

XV.—Applications

British Glues and Chemicals, Ltd., and Drew. Manufacture of glue. 32,412. Dec. 1.

Nance. Treatment of hides. 32,372. Dec. 1.

Zippermayr. Hardening etc. colloids. 32,473. Dec. 1. (Ger., 2.12.26.)

XV.—Complete Specification

*31,432 (1927). Alealai. Tanning-materials. (281.292.)

XIX.—Application

Heriot. Curing raw meats. 32,579. Dec. 2.

XX.—Applications

Deuts. Gold- u. Silber-Scheideanstalt. Preparing 2-chloro-phyridine. 31,958. Nov. 28. (Ger., 3.12.26.)

Gulbraith, Meynell, and Mounsey. Anti-toxines. 32,711. Dec. 3.

I.-G. Farbenind. Manufacture of arsenobenziminazolones. 32,429. Dec. 1. (Ger., 2.12.26.). Manufacture of benziminazolone-arsinic acids. 32,567. Dec. 2. (Ger., 2.12.26.)

Inray (Goldschmidt). Oxidation of alcohol. 32,264. Nov. 30.

Johnson (I.-G. Farbenind.). Production of alcohols. 32,550. Dec. 2. Production of solid formaldehyde. 32,553. Dec. 2.

Neuscheller and Ohle. Manufacture of ethyl alcohol-gels. 32,142. Nov. 29. (Ger., 30.11.26.)

XX.—Complete Specifications

13,302 (1926). Dreyfus. Manufacture of acetic anhydride. (280.972.)

4074 (1927). Johnson (I.-G. Farbenind.). Production of a calcium formaldehyde sulphonylate. (281.134.)

7541 (1927). Holzverkohlungs-Ind. A.-G. Concentrating volatile aliphatic acids. (271.044.)

8300 (1927). Holzverkohlungs-Ind. A.-G. Concentrating raw pyrolytic acid. (271.828.)

18,924 (1927). Chem. Fabr. vorm. Schering. Manufacture of iodine-substituted benzonitriles. (275.213.)

*31,605 (1927). Selden Co. Catalytic oxidation of organic compounds. (281.307.)

*21,496 (1927). Newport Co. Preparing para-hydroxy-ortho-benzoyl-benzoic acid. (281.227.)

XXIII.—Application

Hartley and Hartley. Sewage purification. 31,933. Nov. 28.

XXIII.—Complete Specification

27,345 (1926). Scholz and Eibes. Adhesive compounds for combating insect pests. (281.068.)

GENERAL NOTES**Official Trade Intelligence**

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number :—*Australia* : Chemical lines (Commercial Officer, Australia House, Strand, W.C.2, No. 498). *Austria* : Leather (470). *British India* : Salt, cement, galvanised sheets, black steel sheets, yellow metal (466). *Canada* : Druggists' supplies (467). *Rumania* : Iron and steel (477).

Draft Alkali etc. Works Order, 1927

By a Draft Order, dated November 25, to be issued under the Smoke Abatement Act, 1927, the Minister of Health proposes to make the following additions to the list of gases and fumes included in the "noxious or offensive gases," the escape or discharge of which must

be prevented :—Sulphuric anhydride, sulphurous anhydride (except that arising solely from the combustion of coal), bromine and iodine and their acid compounds, arsenic and its compounds, ammonia, pyridine and fumes from benzene works and from paraffin oil works. The descriptions of scheduled works are proposed to be extended as follows :—“(5) Nitric acid works,” to include those in which any acid-forming oxide of nitrogen is evolved in the manufacture of any product ; “(13) Arsenic works,” to include works in which any volatile compound of arsenic is evolved in any manufacturing process ; “(18) Paraffin oil works,” to include crude petroleum refineries ; “(19) Bisulphite works,” to include those making liquid sulphur dioxide, sulphurous acid, or any sulphite. “(20) Tar works,” to include any manufacturing operation in which noxious or offensive gas is evolved during the distillation or heating of creosote or other coal-tar product. Other works proposed to be added are benzine, pyridine, bromine and hydrofluoric-acid works. Copies of the Draft Order are obtainable from H.M. Stationary Office, price 1d.

Change of Address

Messrs. L. R. B. Pearce, Ltd., the potash merchants, are moving on January 1, 1928, to more commodious premises at 50, Mark Lane, E.C.3. Their new telephone numbers will be Royal 8742 and 8743, and their telegraphic address "Ellarbecpa Fen, London."

Safeguarding of Key Industries : Exemptions from Duty

The question of renewing Exemption Orders Nos. 1, 2, 3 and 4, which are due to expire on March 6, 1928, is now under consideration of the Board of Trade. The articles covered by these Exemption Orders are as follows :—R Acetone, Acetone fermentation, Acetone synthetic, Acid oxalic, Amidopyrin, Ammonium perchlorate, Barbitone, Dial, Didial, Elbon, Ethylene bromide, Ethylene glycol, Furfural, Glycol ethers, Guaiacol carbonate, Hydroquinone, Integrators planimeter type, R Lead acetate, Lead tetra-ethyl, Lipoidin, Methyl sulphonol, Phenacetin, Phenazone, Phytin, Piperazine, Planimeters, R Potassium hydroxide, Potassium guaiacol sulphonate, Pyramidon-veronal, Salol, Sulphonol, Urea.

Any communications with respect to any of the above-mentioned articles should be addressed, before January 8 next, to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, Westminster, S.W.1.

News from Advertisements

The Senate of the University of London invites applications for the Ramsay Memorial Chair of Chemical Engineering tenable at University College.

Applications are invited from mechanical draughtsmen (p. vi).

A man with practical experience is wanted for the manufacture of nitro-cellulose leather cloths (p. vi).

Two 24-in. electrically-driven centrifugal machines are for sale (p. vi).

Various sets of the JOURNAL etc. are required (p. vi).

There are now 129 firms represented in our Buyers' Guide.

EDITORIAL

The Institute of Chemistry

THE Institute of Chemistry celebrated in suitable style last week its fiftieth anniversary. The reception on the 14th inst. was brilliant and well-attended; the banquet on the 15th was even more important. The Institute has enjoyed fifty years of usefulness, and many distinguished chemists have guided its destinies and presided over its meetings. For many years it has been fortunate in having as its secretary an able man, really able who has studied its interests and been responsible in no small measure for its present importance and prosperity. Mr. Pilcher has kept the Institute constantly in his mind as the guardian of the professional side of chemistry, and there are few men so well qualified as he to advise on the profession of chemistry, or more willing to help those who apply to him for information. We suppose that we read his book on "The Profession of Chemistry" when it first appeared in 1919; we read the latest edition of it which appeared this year with a good deal of interest. His views agree so closely with our own that we feel sure that we must have learned much from his experience at the Institute and the early edition of his book. On the other hand, many of our present opinions have not been gathered from books but from our own experience, and we were pleased as well as astonished to find so much that he has said, and so much that he has nearly said, in agreement with what we have long thought. He has the advantage of knowing another profession besides that of the chemist, and although his picture of the present state of the profession is not unduly optimistic, it seems to us to be true in fact and sufficiently encouraging to deserve comment.

There are two matters of importance to chemists, frequently discussed in our correspondence columns: title and remuneration. Mr. Pilcher deals with each of these with knowledge and discretion. His statement of the difficulty about the title shows no very obvious

solution, probably the point is not of supreme importance; solicitors were formerly known as attorneys, they are commonly spoken of as lawyers; there are attorneys who are not solicitors and lawyers who are not solicitors. No confusion worth mentioning has ever been caused by these ambiguities. The question of remuneration is much easier to grapple with if only we are prepared to face the facts. Mr. Pilcher tells us, and we are fully in agreement with him, that chemists are not worse paid than other professional men, and he implies that in the majority of cases they are paid as much as they are worth. Those who call attention to the low salaries offered to junior chemists will find the same feature in other professions. We well remember that when we were twenty-three years of age we had attended a provincial university for three years, studied the law for a further four years, and passed in a creditable manner our professional examination, an examination comparable with scientific examinations; we were offered a salary of £100 per annum and accepted it; no Society protested at this inadequate remuneration, and our friends congratulated us on our good fortune: we were probably not worth a higher remuneration; if we had enough brains, industry, sense and luck, to earn more money the world was in front of us. It certainly did not occur to us that because we had studied for several years, and were entitled to write a few initials after our name, we deserved any increase of remuneration; many friends with less learning, but more knowledge of the world and of men and of money, were already earning salaries larger than ours.

It took us several years to realise quite adequately how much more valuable and how much better remunerated is the knowledge of affairs and of men than the knowledge of a science, or of law, or of history or literature. Had we learned this earlier, we should probably have been richer, but not happier, nor in the widest sense more useful. During the last thirty years, or more, there have been many successful efforts to place higher

education within the reach of a much greater proportion of the population. In all classes of society the pen is ousting the sword, the ploughshare, the spanner, and the counter. The supply of the clerk, the book-man, the man educated in schools and universities, exceeds the demand. The supply of the shoemaker, the fitter, the skilled artisan is less than the demand. A man who knows his trade thoroughly, is diligent and business-like, may consort with captains and kings. Why is it that so many thousands of us prefer the learned and poorly paid life to the unlearned and better paid? It is our pride, our knowledge that we belong to the intellectual side of humanity; we know that Milton, who sold the "Paradise Lost" for a fiver or two, was a greater man than some of our present-day men of letters who flood the daily papers with articles and personalia and make handsome incomes. The successful artisan who has made money early in life and much money in middle life would cheerfully give a few thousand pounds to belong to the intellectual or cultured set; it is impossible. The market is flooded, and for fifty or a hundred years has been flooded, with people who wish to be respectable and dare not run the risks attending the desire of being both respectable and well-paid. The adventurous will find their opportunity; opportunity does not chase the student to his lair. The desire for learning and the desire for money are antagonists; in our editorial capacity we despise money; at other times we sometimes remember the sage advice of a north countryman: "Take care of thy money, my lad; after thy father and mother it will be thy best friend."

We noticed only one mistake in Mr. Pilcher's book, a mistake we ourselves made only a few days ago. He, too, seems to think that students may conduct research, and we must leave him to settle the matter with Prof. Thorpe. Our correspondent "Percy" this week implies that in some of the universities students do have opportunities of research to a greater extent than Prof. Thorpe admits. Perhaps the universities differ in this respect; if Prof. Thorpe and Mr. Pilcher will collaborate they will easily confer a favour on the industrialists; we suggest that they jointly publish a list of the various universities and university colleges in which chemistry is taught, marking in some distinctive manner those which reach the high standard referred to by Prof. Thorpe, and giving some other mark to those in which students conduct research. Such a list would possibly be a valuable addition to the other publications of the Institute. The work of the Institute has, however, not been confined to publication; it has laboured long and successfully to persuade the public to recognise more fully and more generously the importance of the profession of chemistry. Its jubilee meetings this week remind us of many successful banquets and meetings organised by the Institute in the past. The luncheon given by the Salters' Company is a further indication of the interest taken by the City Livery Companies in the advancement of scientific and technical education. A few companies like the Salters, the Dyers, and the Goldsmiths are directly connected with chemistry or metallurgy, including in the latter word the craft as well as the science,

but ever since we came to London we have met with very many instances of splendid support by the Livery Companies, whether directly connected with some particular craft or not. We well remember the work done in this connexion by Sir Owen Roberts and Sir Walter Prideaux; there were probably others who did equal work whom we knew not. The great companies have helped the educational efforts of the country in a very handsome manner. We should be grateful to them for this; many of us have other reasons for being grateful to them; chemists in particular should praise the Salters' Company, coupled with the name of the Worshipful Master. This note is written on his ancestral London estate; his ancestral Yorkshire estate was, in earlier days, equally well known to us. Professional speakers

Mr. R. B. Pilcher, Registrar of the Institute of Chemistry since 1900

usually speak well: his speech at the luncheon was a happy instance of this.

It is not easy for us to say all we think about the President of the Institute, Prof. Smithells; we can, of course, allude to his dignified appearance and graceful style of writing, and to the fact that each year tends to bring him nearer to the stage of being one of our senior chemical professors. We have known him for more years than either he or we care to admit; we studied chemistry under him for a few years, and owe to him that limited acquaintance with chemistry and considerable acquaintance with chemists which has brightened our life for, let us say, five and twenty years; we will admit so long an experience as that. He is too well-known to require any introduction to chemists, and his portrait has already appeared in our columns; as we do not remember to have published a portrait of Mr. Pilcher, we do so this week, so that his many friends and acquaintances in foreign parts may see what sort of man he now is.

THE WASTES OF THE PAPER PULP AND PAPER MILL INDUSTRIES

By J. B. C. KERSHAW

(Concluded)

As regards the present methods in use for dealing with the waste liquors of the sulphite process, it is correct to state, therefore, that in the majority of cases no attempts are made to recover the more valuable organic contents; and any treatment for their removal is done to obtain an effluent which can be turned into rivers and streams without danger to fish life. In the more up-to-date mills the liquor is passed through screens or "save-alls" in order to remove the finer particles of cellulose, and it is then treated with milk of lime and a solution of ferric chloride. A precipitate of flocculent ferric hydrate is thus produced, and on settling carries down all the suspended matter, and also a large proportion of the colouring matters extracted from the wood. The clear liquors from the acid sulphite process, after this treatment, are usually passed over a cascade, in order to remove any mechanically-held sulphur dioxide, before their discharge into drains or water-courses.

A relatively large loss occurs during incineration in the recovery of soda from the "black liquors" in the form of dust carried up the chimney; and the amount of fresh soda required in order to maintain the strength of the liquors varies from 150 lb. to 400 lb. per ton of pulp. Experiments are now being carried out in America with a new type of incinerator which will avoid this loss, and will also permit the utilisation of the carbon contained in this waste as a fuel. Developments have also taken place relating to the evaporation of sulphite waste liquor and the combustion of the concentrated sludge under the boilers. A new type of evaporator has been in successful operation for this purpose for some time, and the residue obtained is stated to have a fuel value of 8000 B.Th.U. per lb., which covers the cost of installation and operation. It is stated this plant can be installed for a capital outlay of \$1250 per ton of pulp per day, and that a plant of this size will deal not only with the main liquors from the digesters, but also with the wash-waters from the blow-pits.

Notes will now be given of recent work relating to improvements in the methods of dealing with these wastes.

Heat recovery from wood-pulp boilers

Nordstrom² has described a method of recovering heat and other valuable materials from the waste gases of the sulphite cellulose boilers, in which the raw cellulosic material which is to be submitted later to the sulphite treatment is charged into a filtering shaft in the form of chips and shavings. The material is partially dried by the hot gases coming from the boiler, and also serves as a filter to remove the dust and other solid matter carried away by the gases. The material in the shaft is then passed on to the boilers, and in this way both the heat of the waste gases and the absorbed products are turned to useful account.

Hanglighter and Schneider, two Canadian engineers,³

have also patented a method of recovering sulphurous acid and heat from the waste gases of sulphite cellulose boilers. This process depends upon suddenly reducing the pressure by withdrawal of part of the gas from the boiler, and leading it into a special storage vessel. The remainder of the gas is then withdrawn through another main where it meets fresh lye passing to the storage vessel or container. The heat absorption occurs on the counter-current principle. Hanglighter and Clemm,⁴ in a later Canadian patent, describe a modification of this method, which depends upon the introduction of the waste gases without any cooling into the fresh lye, the action taking place under pressure in a closed tank.

Improvements in the methods and apparatus for concentrating waste liquors

According to Bradley and McKee,⁵ a method of concentrating black liquor depends upon spraying it into a heated atmosphere containing carbonic acid and sulphurous acid gases. The organic matter is precipitated and a solution of sodium carbonate or sodium sulphite is obtained. In a later patent they describe another method of treatment, which depends upon the use of an ammonium compound, the acid radical of which will form a sodium salt. The organic matter contained in the black liquor is precipitated by lime, and the ammonia, which is set free by this treatment, is driven off by heat. After separating the precipitated organic matter, either by decantation or filtration, the liquor is causticised and again employed in the mill. In yet another modification of the process, nitre cake is used to provide the acid radical.

Brunler⁶ has described recently the application of his submerged flame system of heating to the evaporation of the waste liquors from the sulphite process of pulp manufacture. The ordinary submerged flame apparatus is employed to evaporate the water, and a liquid is produced of the consistency of pitch which can be easily gasified in an ordinary producer plant. Details are given by Brunler of a trial with a sulphite liquor containing 90% of water, which was reduced to less than 20% by aid of the submerged flame. The fuel used for the burner was a lignite tar having a calorific value of 16,400 B.Th.U. per lb., and 120 lb. of this tar was required per ton of liquor evaporated. The quantity of steam produced during concentration was 4295 lb., and after deducting the power required for compression of the combustion air, a surplus of 74 h.p. remained to the credit side of the account. The residue after the evaporation contained 20% of water and possessed a calorific value of 7270 B.Th.U. per lb., and as one ton of the waste liquor yielded 265 lb. of this concentrate, a heat recovery of 1,926,500 B.Th.U. was obtained per ton of sulphite liquor.

A method of evaporating sulphite waste liquors, due to H. A. E. Nilsson,⁷ depends upon the use of the compressed vapours for heating purposes; and in order to reduce the corrosive effects of the acid gases in these vapours upon the metallic parts of the compressor, they are first treated with absorbents or adsorbents to remove the acids before compression.

⁴ Canadian Patent, July, 1923.

⁵ Canadian Patent, Dec., 1923.

⁶ "Industrial Chemist," May, 1927.

⁷ Swedish Patent 58,778, May, 1926.

² U.S. Patent, Oct., 1921.

³ Canadian Patent, June, 1923.

R. H. McKee,⁸ in a recent article, dealing more especially with the recovery of alcohol and other products from sulphite liquors, describes a method of evaporation which furnishes a satisfactory boiler fuel. He states that owing to the colloidal nature of the sulphite liquor, a thermo-compressor type of evaporator can be employed, for the boiling point does not change appreciably during the evaporation. In this form of apparatus there is only a small temperature difference between the two sides: and when operated with steam at 150 lb. pressure, and with a double-effect evaporator, it is possible to evaporate 5.4 lb. of water per lb. of steam employed. This form of apparatus is, in reality, a triple-effect evaporator, and by its use the amount of high-pressure steam required is only 0.185 lb. as compared with 0.276 lb. with a quadruple-effect apparatus. The steam at 150 lb. pressure, which can be produced

The recovery of alkali from the black liquors of paper-pulp mills

In a recent American patent, A. H. White¹⁰ describes a method of regenerating the liquor obtained from the sulphate process of pulp manufacture. This is first subjected to destructive distillation, and the residual salts are heated with lime and carbonaceous material in order to reduce the sodium sulphate. The temperature required is between 600° and 700° C., and the product is finally lixiviated in order to recover sodium hydrate.

L. J. B. A. Colas and others,¹¹ in a patented improvement of the process for the recovery of alkali from black liquor, use calcium acetate as a flocculation catalyst to cause the separation of colloidal particles. The separated material is then treated with a solvent to remove fatty or resinous substances, and the residue is hydrolysed and fermented in order to obtain ethyl

FIG. 2
Sand traps and strainers

per ton of pulp from the raw liquor by this apparatus, amounts to 7450 lb., and 12,480 lb. of water must be evaporated to achieve this result. The steam can be used for the development of power in non-condensing steam engines, and the exhaust from these can be employed again to evaporate the sulphite liquor in multiple-effect evaporators. When expressed in terms of fuel value, the combustible material in the raw liquor is equivalent to 780 lb. of coal, testing 14,000 B.Th.U., and in the fermented liquor to 610 lb. per ton of pulp.

J. E. Plumstead⁹ has patented a method of treating the black liquor by passing it through heat zones of varying intensity in order to effect its evaporation and to produce black ash. The evaporation is so conducted that the material attains its maximum temperature before the evaporation is completed, and in this way any risk of fusion of the ash is avoided.

alcohol. Oxalic acid may be employed as flocculation catalyst, and is recovered before the succeeding treatment with lime.

L. Bradley and E. P. McKeefe¹² in a Canadian patent protect the use of a precipitated basic aluminium compound for the treatment of black liquor from paper-pulp mills. This aluminium compound is first added to the liquor, and carbon dioxide is passed through it in order to throw down a precipitate of alumina in intimate mixture with the organic matter. The precipitate, on destructive distillation, yields a mixture of carbon and alumina, whilst the liquor, after removal of the organic matter, is concentrated and causticised in the usual way. The same two chemists in an earlier Canadian patent¹³ describe a method of concentrating waste liquors by spraying them into hot gases

⁸ "Paper," 1920.

⁹ U.S. Patent 1,600,890, 1924.

¹⁰ U.S. Patents 1,580,260 and 1,575,473, 1925.

¹¹ British Patents 218,288 and 200,482, 1923.

¹² Canadian Patent 245,851, 1925.

¹³ Canadian Patent 236,531, 1923.

containing carbonic acid, such as the waste gases from furnaces.

It is stated by E. D. Rimman¹⁴ that the dry distillation of the residue from waste liquors should be carried first up to the temperature of 400° C. in order to obtain the separation of the more valuable organic products, such as acetone, the alcohols, and ketones. The solid material which remains in the retort is cooled by a water spray down to 250° C., crushed and granulated, and then heated in a rotary furnace up to 750°, in order to causticise the lime. An alternative plan is to burn the residue as a powdered fuel with air, preheated to 1000 or 1200° C., and when the gases produced by this combustion are quite free from sulphur, they may be employed for preheating the lime sludge, obtained during the production of sodium hydrate from the residue. The calcium carbonate obtained in this way can then be burned, in order to recover the lime.

The latest process for the treatment of black liquors, due to C. L. Wagner, is being exploited by the Ross Engineering Corporation of New York. The process is now undergoing trial at a kraft paper pulp mill at Muskegon, in Michigan, and the following particulars are taken from an article by F. E. Coombs.¹⁵ The new method is based upon the atomisation of the liquor, and its evaporation and combustion in this state in a preheated furnace; one portion of the heat produced by the combustion is employed to concentrate the liquor in another apparatus. The method was first tried with the waste liquor from a soda mill, and later with the more difficult sulphate-mill liquor. These experimental tests showed that the heat liberated by atomisation and combustion was considerably in excess of that required to concentrate the liquors from 1.067 sp. gr. up to 1.332 sp. gr. in multiple-effect evaporators. These preliminary tests also proved that it was possible by this method to raise a large amount of steam which could be applied to other purposes, and at the same time to supply 500 gals. of the concentrated liquor per hour for the combustion furnace.

The unit of plant erected at Muskegon consists of a circular vertical combustion furnace provided with means for heating it to the ignition temperature of the concentrated liquor. This is sprayed into it by a number of atomising nozzles, arranged in the upper portion of the front wall of the furnace. These nozzles direct the spray downwards to the centre of the furnace, and a supply of heated air is forced into the furnace from below, in order to support the combustion of the concentrated liquor. A large dust chamber is interposed between the furnace and the 500 h.p. vertical water-tube boiler in which the steam is generated. A powerful induced-draught fan is necessary to give complete control of the draught through the boiler and furnace; and a mechanically-operated gas scrubber and an air compressor are also required. A removable oil nozzle for heating up the furnace when first starting is also required; and it may be necessary to assist the combustion with sawdust or wood waste, in order to complete the reduction of the sodium sulphate to sodium sulphide within the furnace. Generally, however, it has been found possible to reduce an addition of 1 lb. of sulphate

to the corresponding sulphide, per gallon of the concentrate, without the addition of sawdust or other wood waste; but to ensure this reduction it is necessary to maintain a mass of incandescent carbon on the floor of the furnace, at a temperature of 1500° F. This temperature should not be exceeded, since otherwise there will be a considerable loss of sodium salts by volatilisation. A dust chamber of ample dimensions in any case is needed between the furnace and the boiler, for the collection and retention of any soda particles that may be carried over by the draught.

JUBILEE OF THE INSTITUTE OF CHEMISTRY

The Institute of Chemistry was incorporated in 1877, and the celebration of its jubilee began most appropriately on December 14, with a historical exhibition of documents and portraits relating to the foundation of the Institute. The exhibition, which was held in the house of the Institute in Russell Square, included documents and apparatus relating to Joseph Priestley, lent by Mr G. H. Gabb; a series of prints and other exhibits of chemical interest, lent by Mr. C. H. Tribb; and the fine collection of lantern slides illustrating the history of chemistry, which belongs to the Institute.

In the evening of December 14, a *conversazione* was held at the Wharnccliffe Rooms, and the President, Prof. Smithells, F.R.S., and Mrs. Smithells were kept very busy receiving the numerous guests, who included all the leading figures in chemistry, either as members of the Institute or as representatives of allied societies.

During Thursday the New Gallery Cinema was crowded from 10.30 a.m. till after midnight by visitors eager to see the interesting series of films of British industries, which were shown by the courtesy of the Federation of British Industries and the Gaumont Company. Amongst the industries illustrated on the screen were coal and its products, the manufacture of steel, of heavy chemicals, nitrate of soda, and so on.

On the same day the Master and Wardens of the Worshipful Company of Salters celebrated the occasion by entertaining the President and Council, the Past Presidents, Vice-Presidents, and representatives of the sections of the Institute, and delegates of societies attending the Jubilee. An admirable and most interesting speech of welcome to the guests was delivered by the Master, the Rev. T. Basil Woodd, M.A., LL.B., who gave an account of the history of the company, its association with things chemical, and its present purpose in the Salters' Institute. Prof. Smithells made acknowledgment in a graceful speech, and was followed by a Vice-President of the Institute, Mr. E. Richards Bolton, who gave a very happy expression to the thanks of the guests. Prof. H. E. Armstrong then proposed the health of the Master.

The luncheon was a marked success and a most welcome illustration of the sympathy of the City Companies with science and in particular of the Salters' Company with chemistry.

The Institute of Chemistry held its Jubilee Banquet at the Wharnccliffe Rooms, Hotel Great Central, London, on December 15, when Prof. Arthur Smithells, F.R.S. (President), entertained over 500 members and guests on behalf of the Institute. Among those present were:

¹⁴ British Patent 217,285, 1923.

¹⁵ "Chem. and Met. Eng.," July, 1927.

Sir Alfred Mond, Bart., M.P.; Sir Ernest Rutherford (President of the Royal Society); The Hon. Sir Charles A. Parsons, F.R.S.; Prof. J. Millar Thomson, F.R.S. (Past President); Prof. H. Brereton Baker, F.R.S. (President of the Chemical Society); Col. Sir Edward Brotherton, Bart.; Lieut.-Gen. Sir Webb Gillman, D.S.O. (Master-General of Ordnance); Sir Robert Robertson, F.R.S. (Government Chemist); Mr. F. H. Carr, C.B.E. (President of the Society of Chemical Industry); Prof. H. E. Armstrong; Mr. Robert Mond; Prof. E. C. C. Baly (British Association for the Advancement of Science); Sir Richard Gregory (British Science Guild); Mr. H. T.izard, F.R.S. (Department of Scientific and Industrial Research); Mr. E. R. Bolton (President, Society of Public Analysts); Dr. Herbert Leivinstein (President, Society of Dyers and Colorists); Sir Hugh Bell, Bart.; Sir William Waters Butler, Bart. (President, Institute of Brewing); Sir Arthur Keith (President, British Association for the Advancement of Science); Sir Herbert Jackson, F.R.S.; Mr. A. Chaston Chapman, F.R.S.; Sir Dugald Clerk, F.R.S.; Sir Brodie H. Henderson (Institution of Civil Engineers); Sir William J. Pope, F.R.S.; Prof. G. G. Henderson, F.R.S.; Mr. C. A. Hill (Chairman of Council, Association of British Chemical Manufacturers); Prof. W. M. Thornton (Institution of Electrical Engineers); Mr. C. A. Klein (President, Oil and Colour Chemists' Association); Dr. H. H. Morgan; Mr. E. H. Cunningham Craig (Institution of Petroleum Technologists); Mr. H. D. Searles Wood (Royal Institute of British Architects); Mr. E. V. Evans (Institution of Gas Engineers); Prof. J. W. Cobb; Mr. W. J. U. Woolcock, C.B.E. (Association of British Chemical Manufacturers); Mr. J. Arthur Reavell (Vice-President, Institution of Chemical Engineers); Mr. W. Macnab; and Prof. G. T. Morgan, F.R.S.

After the Loyal Toasts had been honoured, the President read the following message from H.R.H. the Prince of Wales:—

"I am glad to be able to congratulate the Institute of Chemistry of Great Britain and Ireland on the completion of fifty years of useful service. The application of science to the daily life of the community becomes more and more apparent; as a consequence, the activities of such societies as yours have an ever-increasing value. The Institute has established a standard of professional education and qualification for the practice of the profession of chemistry—a standard which, I believe, is now recognised in every field of work in which the science is pursued. I am satisfied that nothing is more important at the present day for the well-being of our national industries than that they should utilise to the utmost the resources of science and know that this applies in a high degree to the science of chemistry. I have therefore not only to congratulate the Institute on its past achievements in advancing the efficiency and status of the profession which it represents, but to express my best wishes for its increased prestige and influence."

EDWARD P.

The President said he was sure it would be the wish of those present to send a grateful acknowledgement of this message.

The President said that the Royal Society had not only sent its President (Sir Ernest Rutherford) to the banquet, but had sent the following message:—

"The Royal Society offers its most cordial congratulations to the Institute of Chemistry on the completion of its fiftieth year, and looks forward to a continuation and enhancement of the great services which the Institute has already rendered to the science of chemistry."

Delegates from other societies then presented addresses as follow:—Prof. H. Brereton Baker (Chemical Society), Mr. F. H. Carr (Society of Chemical Industry), Prof. E. C. C. Baly (British Association), Mr. E. R. Bolton (Society of Public Analysts), and Mr. C. A. Klein (Oil and Colour Chemists' Association).

Sir Alfred Mond, Bart., M.P., proposing "The Institute of Chemistry of Great Britain and Ireland," said the Institute was founded in 1877 with very modest beginnings, and it was not until eight years later that it felt itself strong enough and powerful enough to approach the Privy Council with a demand for a charter. By that time the Institute numbered 430 members, and the application for the charter set forth at great length the advantages of such an Institute to the professional chemist and to the State and the community as a whole. The Institute had been founded primarily to give a status to the professional chemist, and to draw an adequate distinction between him and the other kind of chemist who sold drugs from behind a shop counter. The influence of the Institute was manifested in the fact that whereas when the charter was applied for the membership was 430, to-day it was 5200. Undoubtedly membership of the Institute was now recognised as a hall-mark of professional qualifications and ability, and all the important posts in which chemical qualifications were required were held by the members of the Institute. Referring to the list of past presidents of the Institute, Sir Alfred said he had been able to count many of them among his personal friends, and hoped that equally eminent chemists and scientists would hold the office of president in the future, to enable us to extend the boundless ocean of scientific knowledge. That the chemist was making his influence felt was shown in the fact that scientific research had become a catchword among the politicians. In the House of Commons the other day in connexion with the debate on the coal industry it was extraordinary what a lot of people talked of research, but who had not the faintest idea of what it meant. Member after member rose and adjured the Government that if they would only do something for research the coal problem would be solved, as if it were merely a matter of spending so much money and the thing was done. Those who had been brought up with research, and had watched its slow and painfully difficult progress, knew perfectly well that research could not be ordered in the same way as one ordered tea or butter at a store. Research after all was the work of human genius, and the genius was born and not made to order. When we got the genius, these people should be enabled to do their work unencumbered and unmolested by material wants, surrounded by all the opportunities which scientific apparatus and scientific assistance could give them. Even a little more might be done, and these people might be thought worthy of remuneration, say, equal to that of a successful stockbroker, although the research chemist might not be regarded as doing work worthy of the remuneration of a prize fighter. At any rate,

it was work which should not be carried out for a remuneration which just enabled subsistence to be maintained. The reward should be of a more substantial character. The researcher did not research because he wanted to, but because he could not help it, and that was why the world had always sweated him and said what a wonderful person he was without taking any steps to look after him. In industrial research we still had much to learn in this country. He had been struck during his recent visits to Germany by the scale and magnitude upon which industrial research was carried out there. As a consequence, technical results and financial success was secured, and we had no reason to grudge the Germans this because they deserved it on account of the long and patient research which they conducted and the large sums of money which they spent in the hope that the work would produce useful results. There could not be too much of this work going on in the world. No nation had a monopoly of scientific minds or scientific invention. It was the universality of the spread of science that was one of its chief charms. It had no national boundaries, it knew no creed, and was not limited by language. It was found all over the world, and Great Britain had its part to play in this work. Great Britain had never been deficient in great minds in the scientific world, as the history of scientific progress had shown throughout the centuries, and to-day we were not devoid of ideas or inventions. What we wanted was more of them and more support for them and as much co-ordination of the results as possible. Undoubtedly chemistry had more to do with the solution of the world's problems than any other science, and he wished the Institute an even greater success in the future than it had had in the past, that when their successors met in another 50 years' time they would have added to the lustre and the already very fine record of success of the Institute, and that they would be able to speak, also in no uncertain voice, of the good work they had done and the additional laurels they had gained for British science and British chemistry.

The President, replying to the toast, expressed his grateful thanks for what Sir Alfred Moud had said and also for the addresses that had been presented by the representatives of kindred societies, which were a great encouragement to the Institute and an augury for a continuation of the amity and good feeling that had existed between them for so long in the past. The Institute would always be at their service on every occasion when required in the future. In addition to the addresses that had been presented that evening, greetings, congratulations and good wishes had also been received from the German Chemical Society, the French Society of Chemical Industry, the South African Chemical Institute, the Cape Section of the Institute, the New Zealand Section of the Institute, the Malaya Section of the Institute, and the Chemical Industry Club, and he thanked all of them for their kindness and the thoughts expressed. Speaking of the Institute, he said that he himself had been connected with it almost from the beginning, because it was founded when he was a student, and he became a Fellow in 1887. The history of the Institute, down to 1914, had been

recorded in an admirable volume prepared by the Registrar, and this showed how the Institute had responded to the calls of war; that was a record of which the Institute would always be proud. The progress of the Institute down to the present day had justified the hope and illustrated the wisdom of those who founded it for a profession without organisation at the time and a profession which, through the variety of interests, was exceedingly difficult to organise. Yet all these interests had been brought into harmonious union for the benefit of the members of the profession and of the public at large. The Institute had set a high standard of professional qualification and conduct, but at the same time it had not adopted a narrowly dominant attitude in representing the interests of the profession. There were no complaints that the Institute was claiming too much or that it was trying to impose unfair restrictions either upon its own members or upon the public. It was hopeless to attempt adequately to express gratitude to those who had rendered services to the Institute in the past, and all he could say collectively was that the policy of the Institute had been framed on the lines of broad-minded progress and adaptability. Finally, Prof. Smithells paid a tribute to the work of Mr. Pilcher, the Registrar, and his able staff.

Mr. Charles A. Hill, proposing "The Founders and Past Presidents of the Institute," referred in turn to all who have been associated with the Institute either as founders or Presidents, and coupled with the toast the name of Prof. J. Millar Thomson, F.R.S.

Prof. Thomson, in his reply, said he had apparently been chosen for this task because not only was he the senior living past President, but he was also, he regretted to say, the only one alive of those who attended the small meeting in 1875 which really started the Institute of Chemistry. It was a matter of great gratification to him now to see the influence and ramifications of the Institute, and he could only ask those younger members in whose hands the management of the Institute would in due course be, never to forget the one aim of the original founders of the Institute, viz., the training and teaching of the chemist.

Mr. A. Chaston Chapman, F.R.S., proposed "The Guests."

Sir Ernest Rutherford, F.R.S., who made the first reply, said the great advances that had been made in chemistry during the last 50 years had been in the fundamental ideas of the nature of the atoms and molecules which chemists dealt with. Physics and chemistry had been drawing nearer together during this period, and apparently it all depended upon whether one was a chemist or a physicist as to the views held concerning which had absorbed the other. However, there had been, during the past half century, the discovery of the electron, the proof of the transformation of matter, and the detailed work upon trying to open up the structure of the atom. Finally, there had been the later work, still in the stage of transition, of the attempt to resolve the whole of matter into the simplest elements and associated with a type of wave motion. In what direction could we look for advance in the next 50 years? It was perfectly clear that the next important advance would be the attempt to solve

that most difficult of all problems, the nature and origin of chemical combination. When that was accomplished he did not know what there would be left for the chemist to put his hand to.

Sir Atul Chatterjee (High Commissioner for India) also briefly replied.

The final toast was "The Chairman," proposed by Mr. E. R. Bolton, to which Prof. Smithells replied in a few words.

SCIENTIFIC RESEARCH IN RELATION TO ACTINOTHERAPY

The first International Conference on Light and Heat in Medicine, Surgery and Hygiene was held at the Central Hall, Westminster, on December 13 to 16, concurrently with an exhibition of apparatus and accessories for light and heat therapy, which was opened by Sir Alfred Mond.

The afternoon of December 15 was devoted to the discussion of scientific research in relation to the practice of actinotherapy, under the Chairmanship of Prof. E. C. C. Baly, C.B.E., F.R.S., and three papers dealing with various aspects of the problem were presented.

Dr. Leonard Hill, F.R.S., dealt with the applications of ultra-violet light to the curing of disease. Ultra-violet in sunlight varied considerably in different months of the year and different hours of the day. It increased enormously in the summer, and decreased very greatly in the winter. Spectrographic investigation had shown that ultra-violet came from the whole of the sky, as well as from the sun. It was estimated that the ultra-violet coming from the whole of the blue sky amounted to more than the whole of that coming from the sun, even when the sun was high in the heavens. Thus, a patient could be exposed to sky-shine when he could not be exposed to the sun itself. With sky-shine, as distinct from sunshine, the ultra-violet was scattered, and diffused. Spectra taken in various localities were shown to indicate the enormous loss of ultra-violet in a smoky city. Discussing artificial light sources, Dr. Hill said that one could not judge the value of lamps merely by the spectra; the final appeal was a biological method. If vita-glass or vitreosil screens were used with the mercury vapour lamp, it would give a sunlight effect and could be used domestically; but the use of screens at present cut down enormously the intensity of the light. We were at the beginning of an epoch in the prevention of disease which was going to have colossal effects. At the same time, he believed that in the toning up of the body the open air was as important as, if not more important than, light.

Dr. I. M. Heilbron spoke on "Vitamin D and its relation to the irradiation of foodstuffs," and showed how the work of the chemist had helped the study of the problem. The discovery that cholesterol acquired antirachitic properties on irradiation by ultra-violet light, and that the activity of irradiated foods was due to the presence of chemically similar substances, had given great stimulus to research work. These observations were followed by the discovery that cholesterol itself was not the provitamin, but contained a minute quantity

of another substance, to which the antirachitic properties were attributable. This provitamin was probably identical with ergosterol, a substance present in large amount in yeast, and in small amount in human and animal skin. The fact that rickets could be cured by ultra-violet light was thus made clear, and actinotherapy was unified with photochemistry.

As regards the use of natural sunlight, appreciable photo-chemical reaction was likely to occur in this country, even under the most favourable climatic conditions, only during the summer period. For general clinical use, artificial methods of radiation were obviously more satisfactory, and its application deserved the fullest exploitation. It might be argued that, as vitamin D was more effective in the cure of severe rickets than light treatment, the latter was no longer necessary. He thought it more likely that the observed beneficial effects of radiation were due to many specific reactions, of which the formation of vitamin D was the only one as yet definitely characterised. Whether or not vitamins A and E, which were so closely associated with vitamin D in nature, had provitaminic origins equally capable of transformation by light was a question to which, owing to our meagre knowledge of their chemical character, no definite answer could be given. Nor could it be assumed that the number of vitamins yet recognised might not rapidly be supplemented. Apart from this, the knowledge that ultra-violet radiation brought about marked changes in the blood, whereby anti-bodies were seemingly produced, together with its well-known stimulant and bactericidal effects, was sufficient reason for continued application.

The fact that the effective rays concerned in the formation of vitamin D were those occupying the middle ultra-violet region (250 to 300 $\mu\mu$) raised the question whether better results would not be obtained by using restricted parts of the spectrum rather than its entire field. The fact that vitamin D was decomposed by short wave ultra-violet light suggested that the entire range of ultra-violet radiations as obtained from a source such as the quartz mercury lamp was unsuitable, and that screening should be adopted in the light treatment of rickets. Indeed, it was not inconceivable that the short wave ultra-violet radiations, below possibly a range of from 260 to 270 $\mu\mu$, were, despite their low penetrative power, actually detrimental, except in special cases concerned with bactericidal effects. As our knowledge of the chemical effects produced by light treatment increased, and we gained further insight into the specific effect brought about in the tissues, it should be possible to employ lamps of definite wave-lengths and intensity for each specific disease, and he looked for great advances in this direction.

He and other investigators had been able to detect the presence of ergosterol in cottonseed oil, linseed oil, maize oil, and certain samples of ground-nut oil, whereas no evidence could be found of its presence in pure olive oil, soya-bean oil, palm oil, or palm-kernel oil. The possibility of some provitamin being present in the last named oils was not wholly excluded, as the sensitivity of the spectrographic method of analysis depended on the transparency of the oil.

Dealing with the practical applications of irradiated

material, he said that, as cod-liver oil contained vitamin D, it did not require irradiation. The use of cod-liver oil had definite limitations, however, especially in severe cases of rickets, for not only were large doses not tolerated, but different samples of oil varied enormously in antirachitic potency. However, the use of extracts of cod-liver oil, such as Ostelin, provided a source of vitamin D vastly superior to the oil itself. The use of vegetable oils had not yet come within the province of practical application, as means had not yet been devised for their effective irradiation in bulk. On the other hand, many foodstuffs, *e.g.*, dried milk, would lend themselves to irradiation.

With the discovery of the provitamin, irradiated ergosterol preparations were now being largely employed, and Hess had reported favourable results from the use of irradiated dried yeast in place of the extracted ergosterol. Indeed, as Rosenheim and Webster had pointed out, there was now no real obstacle in the way of the mass production of margarine and other foodstuffs, normally deficient in vitamin D, containing quantities of vitamin in excess of that present in butter. Again, its presence in cattle cake would almost certainly be an efficient guard against the known vitamin paucity of winter milk and butter. A new chapter of food chemistry was thus opened up, and we could view the future with confidence. A final point was that one could readily over-irradiate provitamin and render it entirely negative. The vitamin itself, once formed, was labile, and was further altered by light.

Replying to a question as to the temperature which vitamin D would stand, Dr. Heilbron said he could not give a direct answer. He had envisaged treatment at normal temperatures. It had been found that vitamin D would stand very high temperatures under vacuum, and he had worked at temperatures up to 300° C. without destroying the vitaminic action. How it would stand against oxygen at elevated temperatures he did not know.

Mr. Francis H. Carr, C.B.E. (President of the Society of Chemical Industry), said that in his experience vitamins D and A, *in vacuo*, were both stable up to temperatures of at least 180° C. without more than fractional loss of activity over a number of hours. Vitamin A differed greatly from vitamin D, inasmuch as it was rapidly lost if oxygen were present during the application of the heat. On the other hand, vitamin D was not oxidised, and retained activity when in the air. Mr. Carr also emphasised the importance of controlling irradiation in order to arrive at the condition of optimum activation.

Dr. Heilbron said Rosenheim and Webster had shown that 10 minutes' irradiation brought about the best effect using the ordinary quartz mercury lamp, but that the best effect only showed a 10% conversion of the provitamin into the vitamin. Afterwards using the complete spectrum—the vitamin was decomposing as fast as it was being formed. The problem of preventing the decomposition of the vitamin once it was produced lay ahead.

Prof. Baly suggested that in the production of the vitamin from the provitamin it was very possible that we should not under any circumstances be able to get more than a certain maximum value of the vitamin dissolved

in the provitamin. The pioneers in this work must not forget that the solvent in which the vitamin was dissolved might have a great deal to say in the matter.

Dr. F. H. Humphris contributed a paper in which he put forward a number of problems in the solution of which the chemist and the physicist could help the science of actinotherapy. Practitioners in light therapy still lacked a definite scientific explanation as to why good results had often been secured with irradiations which differed in respect of continuity, intensity, and range. Ultra violet light irradiation was most beneficial in the treatment of patients suffering from a lack of calcium salts. Ultra-violet irradiation caused certain changes in the calcium content, but in many cases the calcium content could not be increased because the patient might be lacking in the essentials which were activated by light to facilitate the necessary calcium increase. It was suggested, therefore, that a certain type of patient who failed to improve with light required to be treated with a sensitising drug, which, with ultra-violet irradiation, would be the means of enriching the calcium content. It should be possible for some of the manufacturers, in co-operation with the practitioner, the chemist, and the physicist, to tabulate a preliminary working list of drugs for probable use with ultra-violet irradiations. Also, as the body contained many physiological products which fluoresced, and in which there were certain chemical changes, the substances having absorbed ultra-violet rays, knowledge of these products was essential. A knowledge of these and of the means of ascertaining whether or not a patient had a sufficient supply of them were primary problems to be tackled. Another question to which the specialist in light therapy would like an answer was whether pigmentation or tanning was an index of the powers of resistance of the patient.

Discussing the application of ultra-violet irradiation to foodstuffs in order to impart antirachitic properties to them, he pointed to the need for investigating the quantity and quality of the irradiation to be applied to the various types of foodstuffs, the distance, the conditions of treatment, and to what extent the time factor affected the deterioration of irradiated substances. Was it possible to irradiate milk in quantities large enough to enable us to supply on a large scale a sufficient quantity to combat deficiency diseases? He also asked if the objectionable taste acquired by liquid milk after irradiation by ultra-violet light could be prevented.

On the question of the quality of the rays, he said some lamps were very rich in their output of rays in the invisible spectrum, whilst others were decidedly poor in this respect, but had a preponderance of luminous heat rays. Many people maintained that the ideal outfit should give a spectrum as near the quality of the sun's spectrum as possible, but they would find difficulty in defining what quality of natural sunshine was best suited for therapeutic purposes. Therefore we wanted to know from the physicist from what standpoint we should judge natural sunlight for the standard therapeutic spectrum.

Prof. Baly, at the conclusion of the paper, pointed out that a new Society of Actinology and Actinotherapy had been formed for the purpose of achieving co-operation between chemists, physicists, and clinicians.

SOCIETY OF CHEMICAL INDUSTRY

OFFICIAL NOTICES

BINDING CASES FOR BRITISH CHEMICAL ABSTRACTS AND JOINT INDEX

Abstracts "B" and Index to "A" and "B"

Binding cases for the above publications, in dark blue cloth, will be available, commencing with the 1927 issues.

The price will be 3s. 9d. per set of two cases, postage 6d. extra, or, separately, 2s., postage 3d. extra.

Abstracts "A" and Index to "A" and "B"

Cases are also available in maroon or blue cloth, price 3s. 9d. per set of two cases, postage 6d. extra.

Orders, accompanied with remittance, should be forwarded to Messrs. Gurney & Jackson, 33, Paternoster Row, London, E.C.4.

SUSPENSION OF ENTRANCE FEE

The Council has decided to continue the suspension of the Entrance Fee during the year 1928.

ABSTRACTS IN APPLIED CHEMISTRY

It has been arranged to supply members of the Society with reprints of the Abstracts of Applied Chemistry, printed on one side of the paper only, at the price of £1 for the year 1928.

Applications for these, accompanied by the appropriate remittance, should reach the General Secretary before the end of the present year.

BIRMINGHAM AND MIDLAND SECTION

A joint meeting with the local section of the Institute of Chemistry was held on December 16 in the new buildings of the Department of Biochemistry of Fermentation at the University of Birmingham at Edgbaston (by courtesy of Prof. A. R. Ling).

Prof. Ling, who presided, gave an interesting account of recent work in the University biochemical laboratories. He pointed out that the Department had always recognised that one of its main objects should be original research in the many fields open to investigation in connexion with biological problems. The work of Prof. Brown, his predecessor, was well known, for it dealt with micro-organisms—bacteria and yeasts—and the products obtained when they were cultivated on media containing definite chemical compounds. Prof. Ling stated that when he took up his position as Head of the Department, in 1920, his attention was directed, in the first place, to the chemistry of starch, a subject on which he had worked for many years previously. Methods had been devised for estimating starch in such materials as barley, wheat, and potatoes. These methods were now in use in various agricultural stations.

More than 100 years ago attempts were made to throw light on the constitution of starch, and after it had been discovered that starch might be converted into sugar when it was heated with dilute acid, and that it yielded a sugar when treated with an extract of germinated grain, it was found that by determining the nature of the products formed in these two cases

some light might be thrown on the constitution of starch, since the sugars produced might be regarded as the bricks out of which the starch molecule was built. The data obtained might also be used to explain the digestion of starch in the animal system, and similarly, to throw light on the mashing process carried out in the production of beer and of alcohol. It had long been known that starch in the form of granules consisted of more than one substance, and, in collaboration with D. R. Nanji, he (Prof. Ling) had shown how these two substances—amylose and amylopectin—might be separated. They were present in starch granules in the constant ratio of 2 : 1. Another substance had been recognised as a constituent of the starch granules of cereals by Prof. Schryver, who regarded it as hemicellulose. Amylose when treated with the diastase present in barley or in malt was converted into the sugar named "maltose," whilst amylopectin was converted by the diastase of barley into a substance to which Ling and Nanji had given the name " α -hexa-amylose," together with maltose. By the action of malt diastase on this α -hexa-amylose a series of substances named malto-dextrins was produced, together with a trisaccharide maltose and isomaltose.

Pectins had long been recognised as constituents of the cell wall of plant tissues, but their nature had remained obscure until quite recently. Work carried out in the Department had established the constitution of the so-called pectic acid obtained from these pectin bodies, which were of importance commercially in the confectionery industries on account of their property of forming jellies when boiled with sugars. Researches carried out in the Department had explained the formation of the colouring matter, caramel, when certain sugars were treated with ammonia and subsequently heated, and they had also explained the formation of colour and flavour in barley germinated by the malting process when it was heated on the kiln. This was a brief outline of some of the results which had been achieved in the Department during the past eight years.

The members next inspected the British School of Malting and Brewing and Department of Biochemistry of Fermentation, which now consists of a series of 16 rooms in the new block of buildings. There is a spacious general laboratory, a well-appointed microscope room, and a research laboratory. The professor and the lecturer each have a private room and a laboratory, and there is a special laboratory for analysis, an incubator room, and dark-rooms for photography and polarimetric work. The new departmental library will contain all the books in the university on the biochemistry of fermentation. The laboratories are equipped with the latest forms of apparatus and are unquestionably the best and most up to date of their kind in the country. The Department, which is fully maintaining the high reputation for training and research work built up by the late Prof. Adrian Brown, equips students who obtain an honours degree or a diploma to take appointments in breweries, distilleries and vinegar breweries, either as chemists or as technicians. The Department deals with agriculture and cognate industries, chemistry and bacteriology as applied to food and drugs, and water supply.

BRISTOL SECTION AND FUEL SECTION

A joint meeting was held with the Fuel Section on December 1, when Dr. C. H. Lander gave an address on "Low-temperature carbonisation." There was an excellent attendance, including members of the Bristol Association of Engineers, the Western Junior Gas Association, the Automobile Association (Western Centre), and officials of the Bristol Gas Company.

Dr. Lander said the subject was fraught with problems comparatively easy to deal with in regard to technical working, perhaps less easy to deal with in respect of commercial considerations, but still manageable, and with political considerations which to him at any rate were absolutely impossible to deal with.

The figures for the consumption of coal in this country in 1925 show that about 18% was used for domestic purposes, about 9% went to the making of gas; about 3% or 4% for electricity; for smelting purposes about 10%; general manufactures 35%; miners' coal, 4%. should be added to domestic purposes.

Consideration of these figures showed that the coal could be divided into two categories according to whether it was subject to pre-treatment before use, or whether it was used in the raw state. The amount used in the gas industry and the coke oven industry roughly amounted to about 40 million tons per annum; about the same amount of coal was used for domestic purposes. A considerable proportion of the coal was thus subject to some pre-treatment in order to make other fuels suitable for other purposes, and it was important to see whether any of the other groups might lend themselves to pre-treatment. It did not necessarily follow that it was economically sound to carry out systems of pre-treatment. When all was said and done, coal or the products obtained by pre-treatment of coal were, in the main, used as fuels, and it was only if the fuels made from the raw coal by this pre-treatment could be used with greater efficiency or with greater convenience, or with both, than the original coal that it really became sound economically or scientifically.

In regard to domestic requirements, as long as raw coal was used in the domestic grate, smoke was extremely likely to be given off, and this accounted for a large proportion of the smoke pollution over the whole country. In addition, the smoke which pollutes our towns came from constituents of the coal which were valuable for other purposes. The country imported an enormous quantity of oil and petrol every year, and the Navy at present was absolutely dependent on oil for its fuel supplies.

In view of these facts it appeared at first sight to be very uneconomical to burn coal in the raw state and scatter over the country in the form of smoke a considerable proportion of oils that might be recovered. The advantages of reducing smoke production were undoubtedly very great, but it was not necessary to carbonise all our coal in order to avoid smoke. Extreme statements were sometimes made as to the advantages that would accrue were all our coal carbonised before use, and it was sometimes claimed that this would make us independent of imported oils, but even if the whole of the coal raised, including that used for bunkers

and that exported, were carbonised, it would not suffice for national purposes in an emergency.

While it was possible to state with fair accuracy the amounts of coal now carbonised and the amounts used for domestic and industrial purposes, it was impossible to say definitely the amounts of coal used for the production of heat and power respectively. There was a *prima facie* case for asserting that the country required more coal for heating purposes than for power. The generation of power was always accompanied by certain intrinsic losses. The efficiency of power production from fuel was low—a modern power station usually reckoned about 20%—but the efficiency of heat production from fuel was fairly good. It was essential that more data should be collected as to the exact way in which the heat was finally used. We were not in a position to say the proportion, or even to form an opinion as to how far electricity in industry should go.

The figures quoted above indicate that 9% of the coal raised was used for gas production and 4% for electricity. How these proportions were altering to-day he was not prepared to say, nor would he express an opinion as to whether more economical results would be obtained for the country at large by an alteration in the proportion.

Speaking generally there would appear to be a great advantage if a large proportion of the domestic coal could be subjected to some carbonising process—something that would give a fuel which could be used in the domestic grate with the same facility as coal. The same applied to some industries, but with regard to industrial coal generally the advantages were more doubtful. It was quite possible to consume coal in most industrial appliances without smoke, and that ought to be done.

The consumption of coal in the raw state was not necessarily uneconomical. Where pre-treatment was desirable there still remained the question as to which method was the best, and this depended on the circumstances of each case. There were over 200 different methods of low-temperature carbonisation, and the methods fell into two or three clearly-defined sections, of which two were according to whether the retorts were heated by external or internal means.

Before a technical process became a proposition of value to the country, to the company, or to the customers, there were four stages which had to be gone through. First, a person had the idea and worked it out on the laboratory bench. Second, he took the process and worked it on a slightly larger scale. There was such a large jump, however, from trying a process in a test tube to the actual carrying of it out in a retort carrying 100 tons that the laboratory work frequently gave only a very small proportion of the data required for the large-scale work, so that it was often desirable to try out a plant capable of dealing with a few hundred-weights at a time. Third, this was an enlarged stage 2, but one in which the enlargement was taken up to the full size of a plant which could be multiplied in number, but not in scale. It was not difficult to multiply a plant, but an enlargement of scale frequently introduced new factors. In this stage the coal mostly experienced a different treatment from the treatment in the

laboratory, as conditions in an industrial plant were neither so closely controlled nor so uniform as those in the laboratory. At stage 3, if everything had gone well, material had been produced under ordinary working conditions, and at that stage the purely technical man had gone as far as he could. Fourth, this stage consisted in seeing whether, by multiplying the plant ten, twenty or more times, one could over a period of years make the process pay.

The development of a particular plant, namely, that developed at the Fuel Research Station, through the four stages, was then described and illustrated by means of lantern slides.

The next question that arose was, having got a plant so far which does not seem to be unsatisfactory, to get a try out under commercial conditions. It was pointed out to the Government of the day that it was all very well for people who had a process to make claims about it, but not until they were in a position to put their plans on the table could one do anything to help them. It was eventually suggested that some department, governmental or otherwise, should be given power, since so many claims were being made for low-temperature carbonisation, to test plants where owners were willing, free of charge, and that power was given to the Fuel Research Department. Up to the present a number of low-temperature fuel firms had availed themselves of that offer. An account was then given of those plants which were being developed by private initiative, and which had been tested under the scheme.

The lecturer next dealt with some of the later happenings with regard to low-temperature carbonisation from the national point of view. Various schemes for helping inventors and others to get their plants to such a stage that they could be said to be commercially feasible had been put forward. As a result of many conversations, the President of the National Gas Council, Sir David Milne Watson, was asked to re-examine the question of low-temperature carbonisation plants and see whether any of them were, in his opinion, worth running for three years to see if they could prove themselves commercially, or whether the whole thing was hopeless so far as the gas industry was concerned, and should be given up. He was also asked to say whether, if some suitable arrangement could be made, there was one which he would be willing to try. The result of the inquiry, which took the company over twelve months' examination of many types, was that he informed the Government that there were one or two which presented a certain amount of promise, and he would be willing to try one of them. The arrangement was that the company should be guaranteed the necessary capital, and that they should run one of these plants for three years and publish to the world at large an unbiassed account of how it worked. The plant finally chosen by Sir David was the one developed at the Fuel Research Station. This plant was to be erected at the Richmond Gas Works (small gas works recently taken over by the Gas Light & Coke Co.), and would be designed to supply 100 tons of coke per day to the district. The rich gas would be used in conjunction with gas from other processes, in order to give gas of the correct calorific value for the town's

use. In this plant the retorts would be heated by a hollow wall with flues zigzagging between retorts. The heating would be done by a supply of gas to the bottom flue. That and the air supply, would be the only controls. The air admitted at the bottom was insufficient for complete combustion, and the remainder of the air necessary was added at one or more positions higher up. This method could be made to give extraordinarily uniform results. A great deal of experimental work had been done, working on a full-size model with two dummy retorts (the heat being abstracted by means of water-tanks), and it had been proved that it was easy to get now, by this method of heating, temperatures which did not vary more than a few degrees from the top to the bottom in a length of about 21 ft.

In the past accusations had been levelled against the gas companies that they took no interest in the question of low-temperature carbonisation. The true facts of the matter were that the gas companies would take it up with vigour if they could be shown that it was as good as the processes they were now running.

In the ensuing discussion, Dr. Travers said that if many of the inventors had studied the dynamics of the process, 75% of them would never have attempted to plan a process. He also remarked on the change that takes place at about 500° C.

Mr. Robertson, in thanking Dr. Lander, said that as a humble representative of the high-temperature process, he was very grateful to him for his reference to the charge which had often been brought against the high-temperature people. In that part of the country, Plymouth and Dursley had tried the process, but without success. He also asked questions regarding the use of the pitch produced in fixing the briquette, and whether the resulting product was smokeless. He also asked the lecturer to what extent cast iron had stood the test.

Dr. Howard Butler raised the point that perhaps one of the reasons of low temperature carbonisation failing in some instances was the fact of the fuel being so friable that it was not easily carried about and used for domestic purposes.

Dr. Lander, replying, said that from a scientific point of view, Dr. Travers' figure of 500° C. as the line of demarcation was probably right, but that if a robust coke was required and external methods of heatings were used, the tendency always was to put up the temperature. 625° was a temperature which was fairly well associated with the products from low-temperature carbonisation. He also described the advantages and disadvantages of refractory and metal retorts, and dealt with the question of retort walls bulging. He said that if metallurgists had been as interested in cast iron 20 years ago as they were in the improvement of steel he was certain that by now they would have produced a satisfactory article.

In regard to the pitch, the pitch produced from a ton of coal was not sufficient to briquette the coke produced. It was found the retorts worked better if the coal was screened, and only that over, say, ½-in., put into the retorts. The fines might then be briquetted and the briquettes carbonised, in which case the result was smokeless. The pitch produced would be sufficient for such a process provided the proportion of fine coal were

not too great. Briquettes made with pitch were not smokeless unless they were afterwards carbonised.

He said that with reference to Dr. Butler's remarks the fuel was sometimes friable, but that with a suitable process it could be made fairly robust, though rarely as robust as high-temperature coke.

LIVERPOOL SECTION

A joint meeting of the Section with the Chemical Engineering Group was held on December 16, a paper, entitled "Oil pollution of seas and harbours—and a remedy," being presented. In the absence of Mr. C. S. Garland, the author of the paper, Mr. Albert Beale, one of the inventors of the plant described, read it in his place. (The paper was published in full in CHEMISTRY AND INDUSTRY of December 16.) The lecture was illustrated by a cinematograph film and lantern slides.

In the afternoon a party of members was conducted over the oil-storage installation of the Anglo-American Oil Co., at Dingle Bank, and later inspected the S.S. *Adda*, a Diesel-engined liner belonging to Messrs. Elder Dempster & Co., being also entertained to tea by the owners.

In the evening the lecturer and members of the Committee of the Chemical Engineering Group were guests of the Section at dinner at the University Club.

NOTTINGHAM SECTION

The third meeting of the session was held at University College on December 7, Dr. E. R. Prideaux in the chair, when Prof. R. Robinson, D.Sc., F.R.S., gave a lecture on "The indole group of the alkaloids."

Prof. Robinson said that from the point of view of the structural relationships of plant products the natural bases of the indole group have a double interest. On the one hand, the theory of the formation of isoquinoline alkaloids from amino-acids of the phenylalanine type suggested analogous transformations of tryptophan, and this led to the final elucidation of the constitutions of harmine and harmaline. On the other hand a retrospective survey of the group greatly strengthens the conviction that many alkaloids are actually transformation products of proteins. Even a casual inspection of the formulae suffices for the discovery of the constitutional relation of aribine, harmaline, physostigmine and rutecarpine to tryptophan. Closest to the amino-acid stands its methylated betaine *hypaphorine*, isolated by Greshoff from a Javanese tree. Aribine may be prepared from tryptophan by condensation with acetaldehyde and oxidation of the product; harmaline is methoxydihydroaribine, and rutecarpine contains the same fused benzene-pyrrole-pyridine nucleus. The physostigmine skeleton can be derived by methylating the tryptophan skeleton. The lecturer gave an account of the synthesis and the constitution of harmaline. Indole, skatole, methyl anthranilate (also damascenine) and indoxyl may be regarded as degradation products of tryptophan (or a substituted tryptophan), and it is therefore interesting to notice that rutecarpine and evodiamine contain the carboline nucleus of aribine and harmaline together with an anthranilic-type fragment of a second tryptophan molecule.

SOCIETY OF PUBLIC ANALYSTS

An ordinary meeting was held at the Chemical Society's Rooms on December 7, the President, Mr. E. Richards Bolton, being in the Chair.

Apparatus for determining benzoic acid in foods was demonstrated by Dr. G. W. Monier-Williams. The apparatus shown was devised for carrying out the author's method, based on the principle of passing benzoic acid vapour over moist metallic magnesium, to form a soluble magnesium benzoate, which can be subsequently extracted with hot water.

The use of the sodium flame for polarimetric work was demonstrated by T. McLachlan and A. W. Middleton. A pencil composed of sodium salts is used with a Bunsen burner to obtain a brilliant sodium flame.

"Oil bromide films and their use in determining the halogen absorption of oils," by Harold Toms, M.Sc. (Work done under the Analytical Investigation Scheme.) Oil films exposed to an atmosphere of bromine absorb the halogen quantitatively, and, after removal of the excess of bromine at a low temperature, the bromine absorption can be determined gravimetrically. The method, which gives accurate results with 20 to 50 mg. of an oil, has been used to determine the composition of the insoluble bromide of linseed oil, after removal of the bromine, by prolonged treatment with nascent hydrogen. The iodine values, calculated from the bromine absorbed, agree with those obtained by the Wijs method, except for tung oil, the gravimetric bromine absorption of which stands in a constant relationship to the iodine value. The brominated films of several oils (linseed, menhaden, soya, perilla, etc.) show characteristic differences in appearance.

"Tests for impurities in ether. I. Tests for peroxides," by G. Middleton, B.Sc., and F. C. Hymas, B.Sc. Only organic peroxide (probably dihydroxydiethyl peroxide) is to be expected in ether purified for anaesthesia. The sensitiveness of the various tests for peroxide (which renders the ether less stable) is compared, and two new tests are described. The ferrous thiocyanate test is recommended for official adoption, and a colorimetric limit for the amount of peroxide is proposed. An improved method of preparing the ferrous thiocyanate reagent is described, and it is shown that the test, which gives no coloration with pure ether, is not too stringent for practical purposes.

"Arsenic in coated papers and boards," by H. J. Stern, B.Sc., Ph.D. In general, uncoated papers and boards, and the adhesives used, are unlikely to contain a dangerous amount of arsenic. Mineral pigments are also usually satisfactory, but some of the synthetic inorganic pigments may be dangerous. Thus, a paper coated with an arsenical green may contain over 6 g. of arsenious oxide per sq. metre. Some of the lakes of synthetic dyes, notably magenta and methyl violet, precipitated with arsenious oxide, contain dangerous amounts of arsenic (e.g., 40-5% of As_2O_3). Certain dyes, notably Pigment Scarlet 3B and Orange II, may contain 50 to 100 pts. of arsenic per million. A provisional arrangement is in force among the users of pigments for this purpose, limiting the amount of arsenic to 10 pts. per million, and the boards in use seldom contain more than 2 or 3 pts. per million.

CORRESPONDENCE

"MORE ABOUT RESEARCH"

SIR,—It seems to me there is still much "More About Research" to be written. As I read Prof. Thorpe's letter, he means to tell us that the university student does the manipulative part of a research, that research being instigated, planned and "conducted" by the professor, as part of a more comprehensive series of related researches. If it is true, this is really very sad from the point of view of one who sometimes wants a map to do what may or may not be understood as industrial research. If it be true that a year or more as a post-graduate student has only developed his manipulative skill, it would seem to me to be rather a waste of time. I am by no means alone among industrial chemists in wanting men who can plan and actively control and initiate research, and the least of my difficulties is the finding of men who have experience of mere laboratory methods. The whole real difficulty is in finding men who see there are problems that chemistry can solve, and who can plan a campaign to solve them.

Would it be unreasonable to suggest that prizes, scholarships or other rewards—even a degree—be given for the origination and planning of a limited series of researches; the mere carrying out of the research being considered of secondary importance or altogether omitted? In practice, the value of a completed research depends very largely upon the way in which difficulties are met, but a well-planned research is one that anticipates difficulties and provides for them as far as it possibly can.

Yes, I am disappointed to learn that the professors do not regard the planning and "conduct" of research as an accomplishment of their research students, but I find consolation in the belief that some Professors are not quite so modest in their claims.

You must still call me

"PERCY"

PERSONAL AND OTHER ITEMS

The Physical Society has awarded the Duddell Medal for 1927 to Dr. F. E. Smith, C.B.E., F.R.S., for his important work on the development of electrical instruments.

Dr. G. T. Prior, M.A., F.R.S., has retired from the keepership of mineralogy in the British Museum, after serving for 41 years. He is succeeded by the deputy keeper, Dr. J. L. Spencer, F.R.S.

Dr. A. K. Macbeth, reader in chemistry in Durham University, has been appointed professor of chemistry in the University of Adelaide, South Australia.

Dr. H. Dixon, of Emmanuel College, has been appointed university lecturer in biochemistry at Cambridge for three years.

Mr. W. M. Short, M.Sc., has been appointed demonstrator in chemistry in the Department of Bacteriology in the University of Manchester.

Mr. J. H. Wolfenden, M.A., has been appointed lecturer in chemistry at Exeter College, Oxford.

From Germany the deaths are announced of:—Dr. H. Clemm, director of the Zellstoff-fabrik Waldhoff

since 1902; Prof. F. Giesel, for long chief chemist to the Chininfabrik Braunschweig, Buchler & Co., and an authority on quinine and on radium; Prof. M. Bemberger, emeritus professor of inorganic chemistry in the Technical "Hochschule," Vienna; Prof. H. Strache, director of the Institute of Fuel Technology of the Technical "Hochschule," Vienna, and a well-known authority on gas technology; Dr. P. Groth, the well-known Munich crystallographer; Dr. P. Brandt, director of the noble metal section of the Deutsche Gold- und Silber-Scheideanstalt; Dr. W. Eichholz, director of the Merck research laboratories.

The late Mr. Charles Butler, chairman of Willows, Francis Butler, & Thompson, Ltd., manufacturing chemists, left £24,380.

The late Sir William Galloway, D.Sc., left £5972.

The late Mr. J. Taylor, chairman of the British Insulated & Helsby Cables, Ltd., and various electrical companies, and a director of the British Aluminium Co., Ltd., left £176,897.

The late Mr. R. G. Murray, of Gorton, Manchester, chemical manufacturer, left £10,020.

The late Sir Gerald Muntz, Bt., left £12,784.

The restrictions on the importation of British coal into France have been removed.

Physical and Chemical Survey of the National Coal Resources: Lancashire and Cheshire Survey Committee

The Physical and Chemical Survey of the National Coal Resources is one of the main aspects of the fuel research work of the Department of Scientific and Industrial Research. In pursuance of the Department's policy of carrying out the work by means of local committees appointed in coal areas to advise upon the course of work in those areas, the first committee to be appointed was one to deal with the coalfield of Lancashire and Cheshire. In this area there already existed a research association formed by a number of colliery companies, and known as the Lancashire and Cheshire Coal Research Association. An arrangement was made whereby the Association agreed to carry out the work and to appoint, for its direction, a special executive committee, including representatives of the Fuel Research Board and the Geological Survey of Great Britain.

This Committee has recently been enlarged in order that it should be representative of the whole coalfield, and its composition is now as follows:—Mr. R. A. Burrows (Chairman), Mr. J. T. Browne, Mr. H. O. Dixon, Mr. J. H. Edmondson, Mr. R. Landless, Mr. J. Lomax, Mr. J. T. de Seyfried, Mr. N. Simpkin (Director of Research to the Lancashire and Cheshire Coal Research Association), Mr. F. S. Sinnatt (representing the Fuel Research Board), Mr. T. Stone, and Mr. W. B. Wright (representing the Geological Survey of Great Britain).

Committees are also actively at work in the following areas:—Durham and Northumberland, South Yorkshire, Nottinghamshire and Derbyshire, and North Staffordshire. Another Committee is dealing with the coalfields of Scotland.

A Special Pipette

A "special pipette" which has been devised by Mr. A. Conick (Patent No. 225,084) is constructed as follows:—A pipette, described as a volumeter, having a conical

socket into which is fitted a ground-in safety tube carrying a bulb and tap; the pipette delivers the required volume of liquid when filled to the base of the socket. Liquid is sucked into the safety-tube bulb, the tap above is closed, and the connexion is broken by a gentle rotational movement, the required volume then being automatically delivered. The safety tube is of standard size, and will fit the socket of any volumeter.

Industrial Peace

The General Council of the Trade Unions Congress has decided to accept the invitation of a representative group of employers to join with them in discussions on the problems of British industry. To Sir Alfred Mond is due the initiative of the movement amongst the employers, who include Sir Robert Hadfield, Sir D. Milne Watson, Sir Josiah Stamp, Mr. Arthur Dorman, Mr. S. Courtauld, and other leading industrialists.

Abrasives in Canada

An interesting addition to the publications of the Mines Branch of the Canadian Department of Mines is a series of bulletins dealing with abrasives, by V. L. Eardley-Wilmot. Part I. is devoted to "Siliceous abrasives—sandstones, quartz, tripoli, pumice and volcanic dust," Part II. to "Corundum and diamond," Part III. to "Garnet," and Part IV. to "Artificial abrasives and manufactured products and their uses." The bulletins provide a comprehensive account of the uses, sources of supply, preparation and markets of the various abrasives in Canada, attention being also paid to foreign methods of production and output. Each part is well illustrated with numerous geological maps, flow-sheets, diagrams of plant, and so on, and excellent photographs, and the series constitutes a most valuable compendium of information on abrasives. Three bulletins have so far been received, Part I., price 30 cents, Part II., 15 cents, and Part III., 20 cents.

Industrial Research in Ontario

Speaking at the Toronto branch of the Ontario division of the Canadian Manufacturers' Association, Mr. Ferguson, the Premier of Ontario, said that his Government was prepared to contribute dollar for dollar with the industrialists of the Province for the establishment of an industrial research endowment fund of \$2,000,000 (£400,000), if the money was raised within five years.

Lithium Development in Manitoba

According to a statement issued by the Industrial Development Board of Manitoba, the Silver Leaf Mining Syndicate intends to spend considerable sums on development work in the Province during the winter. A refining plant is being installed at Bradford, England, and lithia ore will shortly be moved out on a larger scale.

Franco-German Chemical Agreement

The report of the agreement between the I.G. and the Committee of French Chemical Industries is now confirmed. The agreement regulates production and sale and guarantees the independence of each of the parties. Further agreements to regulate the extent of overlap in production are being prepared. It is emphasised that there is no question of monopoly or hostility to chemical industries in other countries, as an understanding with similar industries in other countries is expressly contemplated in the agreement.

REVIEWS

THE CONSTITUTION OF GLASS. A series of papers reprinted from the Journal of the Society of Glass Technology. Edited by Prof. W. E. S. TURNER, O.B.E., D.Sc., M.Sc., F.Inst.P. Pp. 191. Sheffield: Society of Glass Technology, 1927. Price 7s. 6d.

Although glass is a material which has long received wide commercial application, our knowledge of its constitution is still very indefinite. There are, however, at the present time, several lines of research on the subject in process of exploitation which offer great possibilities. This work, although it must undoubtedly appeal to a wide scientific public, is, in general, difficult of access (except in the form of abstracts) to those who cannot readily obtain the technical journals on the subject. Realising this difficulty, the Society of Glass Technology has here performed the welcome task of republishing in book form a number of papers from the pages of recent issues of its Journal.

The volume is designed to be representative rather than exhaustive, but it admirably fulfils its function in giving a useful survey in an inexpensive form. Moreover, the results of the investigations outlined give the present position of the branch of which they treat, and probably in not more than one important case have views put forward needing serious modification in the light of subsequent research.

The list of papers includes a study of glasses as supercooled liquids by G. Tammann, an investigation of the ternary system, sodium metasilicate-calcium metasilicate-silica (the region which includes the majority of commercial glasses) by G. W. Morey and N. L. Bowen, and papers on the viscous properties of glass by V. H. Stott and H. le Chatelier, whilst X-ray analysis is represented by a study of the structure of quartz by Sir W. H. Bragg, and of soda-lime-silica glasses by R. W. G. Wyckoff and G. W. Morey. The interesting problem of the changes of property of glass in the annealing range is treated in a paper by A. Q. Tool and E. E. Hill. Theoretical contributions by W. E. S. Turner and F. Eckert summarise the knowledge at present available on the general aspect of the problem, whilst the book is rounded off by an interesting tentative hypothesis as to the nature of the vitreous state by W. Rosenhain.

A. COUSEN

PHOSPHORIC ACID, PHOSPHATES, AND PHOSPHATIC FERTILISERS. By W. H. WAGGAMAN and H. W. EASTERWOOD. American Chemical Society Monograph Series. Pp. 370. New York: The Chemical Catalog Company, Inc., 1927. Price \$7.50.

It would seem as if the great elements involved in organic life are each in turn to have a period of emphasis. Following the breakdown of Liebig's mineral hypothesis, nitrogen claimed a predominant part of our attention. This emphasis on the importance of nitrogen was greatly enhanced by Crookes' notable calculations, which foreshadowed an exhaustion of suitable compounds of nitrogen at a relatively early date. The subsequent establishment of processes for fixing nitrogen from the atmosphere solved this problem, and thenceforth phosphates have taken the predominant place in the literature of plant food.

It can scarcely be said that anyone foresees an exhaustion of available supplies of phosphate, but nevertheless the question of phosphate supplies is not without its difficulties. It would seem that so far as they can be computed the phosphate supplies of North America may not last for another century. Fortunately they cannot be computed with any assurance of accuracy, and even if they do run out the world holds other supplies. In this country the great difficulty of recent years has been the cessation of the output of Bessemer slag consequent upon modifications in the process of steel manufacture.

• The commercial uses of phosphate are manifold. Apart from their outstanding application as plant fertilisers, they are involved in such diverse industries as the refining of sugar, photography, the manufacture of dental cements, the manufacture of fire-proofing compounds, and of rust-proofing compounds, ceramic products, the weighting of silk, the production of fermented liquor, and doubtless other industries. Moreover, the cheaper production of phosphoric acid may make it possible for phosphoric acid to replace sulphuric and other acids in manufacturing processes in which the acid itself is not involved in the end product. It is therefore in no way surprising that phosphoric acid and its compounds form the subject of one of the American Chemical Society's Monographs which are now becoming so familiar to us.

The authors, after a historical introduction, give a concise account of the chemistry of the acids of phosphorus, and a résumé of their rôle in animal and crop metabolism. The sources of phosphate are described in considerable detail, and a full account is given, with many illustrations, of the processes of manufacture, a large section of the book being devoted to the volatilisation processes.

The literature of the subject appears to have been surveyed very exhaustively, and in all the descriptive matter abundant references are given. The book constitutes an invaluable source of reference to those concerned with phosphoric acid from any point of view, and is worthy of the careful study of those concerned with the manufacture of phosphoric acid and phosphates.

The segregation of "so-called available phosphates" and "water-soluble phosphates" into separate chapters, through each of which some discussion of availability is dispersed, seems a little unfortunate. It would, perhaps, be better to discuss the question of availability apart from the systematic description of the phosphates and their production. Our understanding of the availability of phosphates is admittedly very limited and vague, and that makes it all the more necessary that the fact of its vagueness shall be stated concisely.

A further improvement would be effected by a reconsideration of the illustrations. Whilst many of these are excellent, some of the photographs are very obscure, and might be replaced by, or accompanied by, line diagrams. One or two illustrations appear to be unnecessary. The picture of a freight train carrying pebble phosphate in Florida, which might be a picture of any freight train, anywhere, carrying anything or nothing, seems scarcely compatible with the dignity of the book.

N. M. COMBER

COMPANY NEWS

IMPERIAL CHEMICAL INDUSTRIES, LTD.

A circular has been issued to the preference shareholders calling a meeting for December 29, when they will be asked to sanction a resolution giving the directors power to increase the preference capital, as may be deemed expedient from time to time, from £16,220,000 to £22,800,000 by issues out of the existing balance of unissued capital amounting to 6,580,000 shares. The directors explain that they have under consideration the acquisition of additional undertakings, and that the operations will call either for an exchange of shares or a cash consideration. Since this consolidation of chemical interests was formed in December, 1926, it has already acquired the Cassel Cyanide Company on a share exchange basis. Last October the directors declared an interim (maiden) dividend of 3 per cent. on the ordinary shares for the year 1927.

BOOTS PURE DRUG CO., LTD.

An interim dividend has been declared of 6⁰., less tax, on the ordinary shares for the quarter.

BRITISH CYANIDES CO., LTD.

This company has purchased the privately held shares in the Beetle Products Co., making it the owner of the whole of the issued share capital. Col. Josselyn, of British Cyanides, Mr. S. W. Doherty and Mr. C. H. Glassey have been elected directors of the Beetle Products Co.; Col. Josselyn has been elected chairman, and Mr. K. M. Chance managing director.

ALUMINIUM CORPORATION, LTD.

The seventeenth ordinary general meeting was held on December 16, Mr. S. G. Berry presiding. It was not easy to realise at this date all the difficulties that had to be surmounted during the past two years, principally the Eigiau Dam disaster which occurred in November, 1925. In 1926 the company had to start with its works out of commission, and was only able to deal with a small portion of its business at a heavy additional cost. Their first task was to bring the power plant again into service, which took months of very hard work. The works had to be cleared of the debris and the furnaces rebuilt, during which time the rainy season had passed and the benefit of the major portion of the year's rainfall was lost. It was a source of considerable satisfaction that, in spite of all these setbacks, the company was able to show a net profit, after paying running costs and administrative charges, sufficient to cover the first debenture interest (cf. CHEM. AND IND., Dec. 16, 1927, p. 1189). As foreshadowed at the meeting in 1926, the Norwegian Aluminium Factory had been established, and under the arrangement to act as its sole selling agent, the company had already received first deliveries of metal. They had thus gone some way towards retrieving the company's position, firstly, by providing for the full use of the alumina and electrode plants, and secondly, by securing an ample supply of metal for the rolling mills at a cost which will enable the company to compete in the world's markets, with ample facilities for expansion.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned.

Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £30 per ton; Powder, £32 per ton; Extra fine Powder, £34 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 5d.—2s. 10d. per gal.; Pyridinised Industrial, 2s. 7d.—3s. per gal.; Mineralised, 3s. 6d.—3s. 10d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt).—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.
 Diphenylguanidine.—3s. 9d. per lb.

Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton. f.o.b. London.

Sulphur. £9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime. Brown, £10 5s. per ton. Good demand. Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbolic.—Crystals, 7½d.—7½d. per lb. Crude 60's, 2s. 5d. per gal. prompt; lower for 1928 delivery.
 Acid Cresylic, 99/100.—2s. 11d.—3s. per gal. • 97/99.—2s. 4d.—2s. 5½d. per gal. Pale, 95%, 2s. 3d.—2s. 4d. per gal. Dark, 95%, 2s. 1d.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40% £5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 7d. per gal., ex works in tank wagons.
 Toluene.—90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 10d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.
 Creosote.—Cresylic 20/24%.—10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7½d. per gal. ex works. Salty, 7d. per gal., less 1¼%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/100, 9½d.—10½d. per gal. Solvent 95/100, 1s. 3d.—1s. 4d. per gal. Solvent 90/100, 8½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £13—£13 10s. per ton. Flaked, £14—£15 per ton.
 Pitch, medium soft.—85s.—90s. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—5s. 6d.—6s. 6d. per gal. 90/180.—3s. 6d.—5s. per gal. Heavy.—3s.—3s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.

Acid Gamma.—4s. 6d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid H.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—8d. per lb., naked at works.
 Aniline Salts.—8d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb., 100%.
 Benzaldehyde.—2s. 3d. per lb.

Benzidine Base.—3s. 3d. per lb. 100% basis d/d.

Benzoic Acid.—1s. 8½d. per lb.

o-Cresol 29/31° C.—5½d. per lb.

m-Cresol 98/100%.—2s. 3d.—2s. 5d. per lb.

p-Cresol 32/34° C.—2s. 3d.—2s. 5d. per lb.

Dichloraniline.—1s. 10d. per lb.

Dimethylaniline.—1s. 11d. per lb.

Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.

Dinitrochlorbenzene.—£84 per ton d/d.

Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.

Dinitrotoluene.—66/68° C.—9d. per lb., naked at works.

Diphenylamine.—2s. 10d. per lb. d/d.

a-Naphthol.—2s. per lb. d/d.

β-Naphthol.—10d. per lb. d/d.

a-Naphthylamine.—1s. 3d. per lb.

β-Naphthylamine.—3s. per lb.

o-Nitraniline.—5s. 9d. per lb.

m-Nitraniline.—3s. per lb. d/d.

p-Nitraniline.—1s. 8d. per lb.

Nitrobenzene.—6d. per lb., naked at works.

Nitronaphthalene.—1s. 3d. per lb.

R. Salt.—2s. 2d. per lb.

Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.

o-Toluidine.—8½d. per lb.

p-Toluidine.—2s. per lb., ex works, naked.

m-Xylidine Acetate.—2s. 6d. per lb. 100%.

N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.

Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.

Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum.—1s.—1s. 3d. per oz., according to quantity.

Acid, Boric B.P.—Cryst. 36s.—39s. per cwt. Powder 40s.—43s. per cwt.; Extra Fine Powder, 42s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.

Acid, Camphoric.—19s.—21s. per lb.

Acid, Citric.—1s. 6½d.—1s. 7d. per lb. Less 5%.

Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.

Acid, Pyrogallic, Cryst.—7s. 3d. per lb. Resublimed.—8s. 3d. per lb.

Acid, Salicylic.—B.P. pulv. 1s. 2½d.—1s. 3½d. per lb. Technical 11½d.—11½d. per lb.

Acid, Tannic, B.P.—2s. 8d.—2s. 10d. per lb.

Acid, Tartaric.—1s. 3½d. per lb. Less 5%.

Acetanilide.—1s. 6d.—1s. 9d. per lb. for quantity.

Amidol.—7s. 6d.—9s. per lb. d/d.

Amidopyrin.—8s.—8s. 3d. per lb.

Ammon. Benzoate.—3s. 3d.—3s. 5d. per lb., according to quantity.

Ammon. Carbonate B.P.—Lump £37 per ton. Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.

Atropine Sulphate.—9s. per oz.

Barbitone.—5s. 9d.—6s. per lb.

Benzonaphthol.—3s. 3d. per lb.

Bismuth Carbonate.—10s. 4d. 10s. 7d. per lb. Bismuth Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—9s. 10s.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb. Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Subchloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.—8s. 1d.—8s. 4d. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi et Ammon. Cit. B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.

Borax B.P.—Crystal 25s. per cwt. Powder 26s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—1s. 11d.—2s. 1d. per lb.

Potassium.—1s. 7½d.—1s. 9½d. per lb. Sodium.—1s. 10d.—2s. per lb. Granulated ½d. per lb. less.

All spot. Large quantities at lower rates.

Calcium Lactate B.P.—1s. 2½d.—1s. 3½d. per lb.

Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.

Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.

Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.

Creosote Carbonate.—6s. per lb.

Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.

Formaldehyde.—£39 per ton. Ex wharf in barrels.

Guaiacol Carbonate.—4s. 9d.—5s. per lb.

Hexamine.—2s. 3d.—2s. 6d. per lb.

Homatropine Hydrobromide.—30s. per oz.

Hydrastine Hydrochlor.—English make offered, 120s. per oz.

Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s.—2s. 3d. per gal.; 20 vols., 3s.—4s. per gal.

Hydroquinone.—3s. 10d. per lb.

Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots.

Potassium 4s. 1d. per lb. Sodium 4s. per lb.

Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.

Iron Perchloride.—18s.—20s. per cwt., according to quantity.

Magnesium Carbonate.—Light Commercial £31 per ton net.

Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.

Menthol.—A.B.R. recryst., B.P., 15s. 6d. January delivery per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.

Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb.; Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb.; Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb.; Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.

Methyl Salicylate.—1s. 9d. per lb.

Methyl Sulphonate.—9s.—9s. 3d. per lb.

Metol.—9s.—11s. 6d. per lb. British make.

Paraformaldehyde.—1s. 9d. per lb. 100% pdr.

Paraldehyde.—1s. 4d. per lb. Less in quantity.

Phenacetin.—2s. 6d.—2s. 9d. per lb.

Phenazone.—4s.—4s. 3d. per lb.

Phenolphthalein.—6s. 6d.—6s. 9d. per lb.

Potass. Bitartrate.—99/100% (Cream of Tartar) 96s. per cwt., less 2½%.

Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.

Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.

Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.

Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.

Potass. Permanganate.—5½d. per lb. spot.

Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.

Resorcin.—2s. 10d.—3s. per lb. spot.

Saccharin.—55s. per lb., and lower in quantity.

Salol.—2s. 4d. per lb.

Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.

Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.

Sod. Ferrocyanide.—4d. per lb., carr. paid.

Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.

Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net. Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7d.—1s. 9d. per lb. Crystal, 1s. 8d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton according to quantity, delivered U.K.
 Sulphonol.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 3d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Aubepine (ex Anethole).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate.—5s. 3d. per lb. Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s. per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 3d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 3d. per lb. Geraniol (Palmarosa).—17s. 9d. per lb. Geraniol.—6s.—10s. per lb. Heliotropine.—4s. 9d. per lb. Iso Eugenol.—13s. per lb. Linalol.—(ex Bois de Rose) 14s. per lb.—(ex Shui Oil) 9s. 9d. per lb. Linalyl Acetate.—(ex Bois de Rose) 17s. 6d. per lb.—(ex Shui Oil) 13s. 9d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—31s. 6d. per lb. Sufrol.—1s. 6d. per lb. Terpeneol.—1s. 8d. per lb. Vanillin.—15s. 3d.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb. Bergamot.—26s. per lb. Bourbon Geranium.—13s. per lb.
 Camphor.—9d. per lb. Cananga, Java, 15s. 9d. per lb. Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d. per oz. Citronella.—Java, 1s. 9d. per lb., c.i.f. U.K. port, for shipment over 1928: Ceylon, Pure, 1s. 7d. per lb. Clove, pure 5s. per lb.
 Eucalyptus, Australian.—2s. 1d. per lb. Lavender.—Mont Blanc, 38/40%, 17s. per lb. Lemon.—8s. 6d. per lb. Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d. per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian, 75s. per oz. Palma Rosa.—10s. 3d. per lb. Peppermint.—Wayne County, 15s. 9d. per lb. Japanese, 8s. per lb. Petitgrain.—7s. 9d. per lb. Sandalwood.—Mysore, 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST.

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Feb. 13th, 1928. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C. 2, on Dec. 29th 1927. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Bowrey, and Duckham & Co. Apparatus for heating materials. 33,153. Dec. 7. (U.S., Electroflux, Ltd. Refrigeration. 33,099. Dec. 7. (U.S., 8.12.26.)

Erz u. Kohle-Flotation Ges. Classifying materials. 32,974. Dec. 6. (Ger., 22.3.27.)

 Johnson (I.-G. Farbenind.). Improving absorption capacity of materials. 33,468. Dec. 10.
 Lehmann and Lehmann. Filter presses. 32,766. Dec. 5. (Ger., 19.9.27.)
 Metallwerke vorm. J. Aders. 32,848. See VII.
 Montgomerie. Producing emulsions. 33,300. Dec. 9.
 Rigby. Rotary kilns. 33,431. Dec. 10.
 Wade (Thomas). Manufacture of desiccating material. 33,376. Dec. 9.
 Zwicky. Filters. 33,372. Dec. 9.

I.—Complete Specifications

20,955 (1926). Billwiller. Prevention and removal of incrustation in boilers. (281,361.)
 21,570 (1926). Illingworth Carbonisation Co., Ltd., and Illingworth. Separation or extraction of liquids from materials. (281,390.)
 31,512 (1926). Kemp and Thomson. Apparatus for separating solid materials by the float and sink method. (281,479.)
 10,217 (1927). Marks (Polysius). Tube and drum mills. (281,528.)
 *31,879 (1927). Krupp A.-G. Centrifuging-machines. (281,649.)
 *32,145 (1927). Buechler, Kiser et Cie. Vertical drying-apparatus. (281,664.)
 *32,289 (1927). Soc. L'Air Liquide. Liquefying and separating the constituents of gaseous mixtures. (281,675.)
 *32,440 (1927). Fischer. Apparatus for treating solutions. (281,695.)

II.—Applications

Anglo-Saxon Petroleum Co., Ltd., and Dawson. Refining petroleum distillates. 33,207. Dec. 8.
 Axtell Research Laboratories, Inc. Refining petroleum. 30,397. Dec. 9. (U.S., 27.12.26.)
 Chamber Ovens, Ltd. (Pintsch & Otto Ges.). Carbonisation apparatus. 33,091. Dec. 7.
 Crunston. Carbonisation of coal. 32,801. Dec. 5.
 Dupont. Carbonising-oven. 32,966. Dec. 6. (Fr., 8.12.26.)
 Electroflo Meters Co., Ltd. (Republic Flow Meters Co.). Gas analysis apparatus. 32,721. Dec. 5.
 Gas Accumulator Co. (United Kingdom), Ltd. Manufacture of porous masses for storing explosive gases. 32,808. Dec. 5. (Ger., 4.12.26.)
 Hirschberg. Treatment of carbonaceous etc. materials. 33,216—7. Dec. 8.
 Humphreys & Glasgow, Ltd. Manufacture of gas. 32,967. Dec. 6. (Fr., 8.2.27.)
 I.-G. Farbenind. Manufacture of liquid products from coal etc. 33,339. Dec. 9. (Ger., 20.12.26.)
 Johnson (I.-G. Farbenind.). Production of liquid hydrocarbons. 32,797. Dec. 5.
 Lee and Slate. Drying and purification of coal gas etc. 33,305. Dec. 9.
 Pope. Low-temperature carbonisation apparatus. 33,336. Dec. 9.
 Saniter, and United Steel Companies, Ltd. Working gas-producers. 33,150. Dec. 7.
 Siemens & Halske A.-G. Determining content of combustible gas in gas mixtures. 33,272. Dec. 8. (Ger., 10.12.26.)
 Wischin. Purifying used lubricating oil. 33,245. Dec. 8. (Ger., 3.11.27.)

II.—Complete Specifications

14,299 (1926). Low-Temperature Carbonisation, Ltd., and Parker. Retort furnaces for distillation of coal etc. (281,348.)

30,340 (1926). Cooper, Holmes, and Holmes & Co., Ltd. Treatment of coal-gas etc., and production of ammonium sulphate. (281,474.)

31,512 (1926). Kemp and Thomson. *See* I.

25,327 (1927). Brand and Laing. Utilisation of pulverulent or powdered carbonaceous materials. (281,588.)

*31,965 (1927). Soc. Anon. La Carbonite. *See* III.

*32,808 (1927). Gas Accumulator Co. (United Kingdom). Manufacturing porous masses for storing explosive gases. (281,718.)

III.—Applications

Cox and McDermott. Purification of benzol etc. 33,256. Dec. 8.

Morgan & Pratt. Treating tar etc. 32,929. Dec. 6.

III.—Complete Specifications

19,499 (1926). Prodorite, Ltd. Pitch compositions. (256,640.)

13,122 and 14,641 (1927). Still. Recovering sulphuric acid from acid-tar of benzol purification. (277,619 and 281,547.)

*31,965 (1927). Soc. Anon. La Carbonite. Separating-apparatus for tar etc. (281,653.)

IV.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of sulphonic acids etc. 33,131. Dec. 7.

Fabr. de Prod. de Chimie Organique de Laure. Manufacture of primary amines. 33,355. Dec. 9. (Fr., 9,12,26.)

Imray (Soc. Chem. Ind. in Basle). 32,981. *See* XX.

Johnson (I.-G. Farbenind.) Production of vat dyestuffs. 32,799. Dec. 5. Manufacture of anthracene dyestuffs. 33,340. Dec. 9. Manufacture of salts of acid sulphuric esters of nitroxyanthraoles. 33,341. Dec. 9. Dyes. 33,469. Dec. 10.

Morgan and Harrison. Manufacture of acenaphthene derivatives. 33,199. Dec. 8.

IV.—Complete Specifications

23,917 (1926). I.-G. Farbenind. Preparing Bz-2 hydroxy-benzanthrone. (258,910.)

19,602 (1927). I.-G. Farbenind. Manufacture of derivatives of acenaphthene. (274,902.)

*32,679 (1927). Soc. Chem. Ind. in Basle. Manufacture of dyestuffs. (281,713.)

V.—Applications

Bemberg A.-G. Production of artificial threads. 33,399. Dec. 9. (Ger., 20,1,27.)

Harrison. Manufacture of artificial filaments from cellulose esters. 33,203. Dec. 8.

Lucas, and Vickers, Ltd. Treatment of fibrous materials. 33,232—3. Dec. 8. Obtaining fibres for spinning. 33,241. Dec. 8.

Soc. Chem. Ind. in Basle. Manufacture of artificial materials. 32,803. Dec. 5. (Switz., 4,12,26.)

V.—Complete Specifications

13,300 (1926). Dreyfus. Treatment of yarns, fabrics, films, etc. (281,084.)

16,363 (1926). Lilientfeld. Manufacture of artificial materials from viscose. (281,351.)

16,449 (1926). Lilientfeld. Manufacture of artificial threads. (281,352.)

30,316 (1926). British Dyestuffs Corp., and Hailwood. Natural vegetable fibre. (281,473.)

*31,678 (1927). Böhm. Chlorination of hair and wool. (281,646.)

*32,002 (1927). Kuppel. Manufacturing impermeable paper. (281,655.)

*32,143 (1927). Eschingen. *See* XI.

*32,308 (1927). Sajitz and Pott. Production of viscose. 281,679.)

VI.—Applications

Hackenbroich. Impregnating-apparatus for dyeing fabrics. 33,158. Dec. 7. (U.S., 13,8,27.)

Imray (I.-G. Farbenind.). Dyeing animal fibres. 32,804. Dec. 5. Production of fast dyes etc. 32,982. Dec. 6.

VI.—Complete Specifications

22,058 (1926). British Dyestuffs Corp., Baddiley, Chorley, and Brightman. Dyeing with azo dyes. (281,410.)

28,783 (1926). Soc. Chem. Ind. in Basle. Dyeing cellulose esters. (261,423.)

*31,921 (1926). Zethtitz and Pfeifer (Brosch). *See* XV.

32,445 (1927). Herminghaus & Co. Ges. Modifying the capacity of cellulose-containing materials for taking up colours. (281,696.)

*32,568 (1927). Soc. Chem. Ind. in Basle. Producing fast tints on cellulose esters or ethers. (281,704.)

VII.—Applications

Ashcroft. Recovering constituents of metallic salts. 32,793—4. Dec. 5.

Caro and Frank. Production of hydrocyanic acid. 32,837. Dec. 5. (Ger., 17,12,26.)

Hayhurst. Pumping acid for acid towers etc. 33,490. Dec. 10.

Johnson (I.-G. Farbenind.) Recovery of phosphoric acid from crude phosphates. 32,796. Dec. 5.

Metallwerke vorm. J. Aders. Obtention of salt by vacuum evaporation. 32,848. Dec. 5. (Ger., 4,12,26.)

VII.—Complete Specifications

28,290 (1926). Dand. Limestone. (281,460.)

29,091 (1926). Weyman and Wallis. Saturators for manufacture of crystalline salts. (281,465.)

29,866 (1926). Lundin. Producing carbonic acid gas. (278,304.)

30,340 (1926). Cooper, Holmes, and Holmes & Co., Ltd. *See* II.

514 (1927). Johnson (I.-G. Farbenind.). Manufacture of anhydrous chlorides and hydrogen chloride. (281,491.)

4732 (1927). Sharp (Soc. Gén. Metallurgique de Hoboken). Manufacture of sulphuric acid. (281,510.)

15,115 (1927). Petersen. Manufacture of sulphuric acid. (281,551.)

*25,890 (1927). Caro and Frank. Production of high per cent calcium cyanamide. (281,610.)

*25,894 (1927). Caro and Frank. Production of the cyanamides of the alkaline earth metals and magnesium. (281,611.)

*31,529 (1927). Norsk Hydro-Elektrisk Kvaestofakt. Concentration of dilute nitric acid. (281,642.)

*32,430 (1927). Fröcher. Concentration of nitric acid. (281,691.)

*32,848 (1927). Metallwerke vorm. Aders. Obtaining salt by vacuum evaporation. (281,726.)

VIII.—Application

British-Thomson-Houston Co., Ltd. Production of vitreous silica. 32,771. Dec. 5. (U.S., 29,12,26.)

VIII.—Complete Specifications

21,343 (1927). United States Metals Refining Co. Magnesite refractories. (276,916.)

*32,673 (1927). British Thomson-Houston Co., Ltd. Abradant material. (281,711.)

IX.—Applications

Bouzin. Kilns for cement etc. 33,249. Dec. 8.

Hadfield. Coloured building material. 33,243. Dec. 8.

IX.—Complete Specification

*32,428 (1927). I.-G. Farbenind. Manufacture of acid-proof cementing-compositions. (281,689.)

X.—Applications

Ashcroft. Treatment of ores. 32,786 and 32,790—1. Dec. 5. Metallurgy of lead-bearing compounds etc. 32,787.

Dec. 5. Recovering zinc etc. from blue powder etc. 32,788.
Refining etc. silver-lead bullion etc. 32,789. Dec. 5. Pro-
duction of metals from minerals. 32,795. Dec. 5.
Boumphrey. Prevention of corrosion of metals. 33,426.
Dec. 10.

Feild. Manufacture of stainless iron. 33,489. Dec. 10.
(U.S., 18,12,26.)

Haughton and Rosenham. Iron alloys. 32,928 and 32,930.
Dec. 6.

Jackman & Co., Ltd., and Neville. Cupola furnaces.
33,178—9. Dec. 8.

Jones, and Sylvette, Ltd. Acid-resisting alloy. 33,037.
Dec. 7.

Kantzow. Fire-resistant alloys. 33,495. Dec. 10.
Manos. Alloys. 33,484—5. Dec. 10. (Switz., 11,12,26.)

Siemens-Schuckertwerke. Annealing furnaces. 33,271.
Dec. 8. (Ger., 9,12,26.)

Sicurin. Production of iron sponge. 33,012. Dec. 6.
Standard Telephones and Cables, Ltd. (Matériel Télé-
phonique). Manufacture of lead antimony alloys. 33,472.
Dec. 10.

X.—Complete Specifications
13,444 (1926). Guggenheim, Guggenheim, Guggenheim,
Guggenheim, MacGowan, and Smith. Metallurgy of tin.
(254,284.)

15,185 (1926). Davies (Watkins). Pickling, annealing,
and otherwise treating metal sheets. (281,349.)

18,137 (1926). Liban. Coating iron articles with tin and
zinc. (281,357.)

23,829 (1926). Jessup. Electrolytic preparation of mag-
nesium and metals of the alkaline earths. (259,554.)

*28,575 (1927). Meyer. Manufacture of steel. (281,621.)

XI. Applications
British Thomson-Houston Co., Ltd. Filaments for incan-
descent lamps etc. 33,105. Dec. 7. (U.S., 3,12,26.)

Electric Furnace Co., Ltd., and Taylor. Electric induc-
tion furnaces. 33,113. Dec. 7.

Hatfield. Electrodes for indication etc. of chemical com-
position of liquids. 32,876. Dec. 5.

Kershaw and Woodbridge. Electric batteries. 33,285.
Dec. 8.

Mallon. Electric accumulators. 33,501. Dec. 10. (Fr.,
11,12,26.)

XI.—Complete Specifications
21,444 (1926). Davis, and Metropolitan-Vickers Electrical
Co., Ltd. High-frequency electric induction furnaces.
(281,379.)

23,829 (1926). Jessup. See X

*32,143 (1927). Eschngen. Increasing electric disruption
strength or resistance of films of cellulose esters or ethers.
(281,663.)

*32,453 (1927). Schmid. Galvanic cells. (281,698.)

XII.—Applications
Flesch. Production of sulphonated oils and fats. 33,338.
Dec. 9. (Ger., 27,1,27.)

Hurrell. 32,950. See I.

Kellett. Soap preparation. 33,435. Dec. 10.

Kernot. Refining and bleaching fish oils. 33,412. Dec. 10.
Montgomerie. 33,300. See I.

Reddie (A.-G. für Medizinische Produkte). 33,022. See
XIX.

XII.—Complete Specifications
30,027 (1926). Horn. Producing clear oils soluble in water.
(281,476.)

*31,208 (1927). Oel- u. Fett-Chemie Ges. Treating tall oil.
(281,637.)

XIII.—Applications
Major. Production of lamp black. 33,015. Dec. 6.

Trist. Printing-ink. 33,334. Dec. 9.

XIII.—Complete Specifications
21,406 (1926). Bennett and Hadfield. Treatment of resins
for making varnish, paints, etc. (281,377.)

28,218 (1926). Wade (Titanium Pigment Co., Inc.). Manu-
facture of composite titanium pigments. (281,459.)

XIV.—Applications
Galbraith and Mills. Preparation of synthetically-produced
rubber. 32,761. Dec. 5.

Johnson (I.-G. Farbenind.). Production of rubber. 32,798.
Dec. 5.

XIII.—Complete Specifications

21,406 (1926). Bennett and Hadfield. Treatment of resins
for making varnish, paints, etc. (281,377.)

28,218 (1926). Wade (Titanium Pigment Co., Inc.). Manu-
facture of composite titanium pigments. (281,459.)

XIV.—Applications
Galbraith and Mills. Preparation of synthetically-produced
rubber. 32,761. Dec. 5.

Johnson (I.-G. Farbenind.). Production of rubber. 32,798.
Dec. 5.

XIV.—Complete Specifications
28,908 (1926). Consort. f. Elektrochem. Ind. Manufacture
of products resembling rubber. (261,748.)

32,957 (1926). Standinger. Manufacture of hydro-cyclo-
caoutchouc. (263,862.)

*27,209 (1927). Goodyear Tire & Rubber Co. Preserving
rubber. (281,616.)

XV.—Complete Specifications
13,260 (1927). Jager, and Herold A.-G. Manufacture of
white artificial horn. (281,537.)

*31,921 (1926). Zettlitz and Pfeiffer (Brosch). Method of
tanning and dyeing furs and leather. (281,592.)

XIX.—Applications
Bennett. Foodstuffs. 32,923. Dec. 6.

Chem. Fabr. Schlutup. Leaching fish waste etc. 33,107.
Dec. 7. (Ger., 7,12,26.)

Massard. Method of producing almond-milk product.
33,391. Dec. 9. (Switz., 10,12,26.)

Redde (A.-G. für Medizinische Produkte). Manufacture of
margarine etc. 33,022. Dec. 6.

XIX.—Complete Specifications
21,452 (1926). Jellicoe. Preserving fruit etc. (281,380.)

5711 (1917). Schwartzauer Hongwerke u. Zuckerraffinerie
A.-G. Manufacture of pectin products. (281,513.)

8929 (1927). Posternak. Obtaining the total bodies con-
taining phosphorus and iron derived from the proteids of
egg yolk. (268,805.)

XX.—Applications
Carpmael (I.-G. Farbenind.). Manufacture of derivatives
of hydroxy compounds containing mercury. 33,205.
Dec. 8.

I.-G. Farbenind. Manufacture of gland preparations etc.
33,114. Dec. 7. (Ger., 11,1,27.)

Inray (Soc. Chem. Ind. in Basle). Manufacture of uni-
laterally acylated diamines. 32,981. Dec. 6.

Thuniss, and Wellcome Foundation, Inc. Preparation of
soluble salts of ergotoxine. 33,095. Dec. 7.

XX.—Complete Specifications
21,149 (1926). Vidal (Riedel A.-G.). Production of active
sedative, hypnotic, and sleep-producing compounds. (281,365.)

27,864 (1926). Scheller. Arsenising organic compounds.
(261,026.)

1169 (1927). Soc. Chem. Ind. in Basle. Obtaining
highly active substances from female secretory organs.
(265,567.)

3427 (1927). Riedel A.-G. Producing adipic acid and its
alkyl substitution products. (265,959.)

6494 (1927). Parke, Davis & Co. Measles toxin and anti-
toxin. (267,520.)

10,528 (1927). Abraham. Production of a material con-
taining thymol and polymerised formaldehyde. (281,530.)

20,472 (1927). I.-G. Farbenind. Manufacture of asym-
metrically substituted diamino-propanols. (275,622.)

21,300 (1927). I.-G. Farbenind. Manufacture of 1-amino-
3-dialkylamino 2-propanols. (270,012.)

21,544 (1927). Wellcome Foundation, Ltd., Henry, and
Sharp. Preparation of therapeutic substances. (281,582.)

*31,958 (1927). Deuts. Gold- u. Silber-Scheideanstalt.
Preparing 2-chloropyridine. (281,650.)

*32,142 (1927). Ohle and Othmarneuscheller. Manufacture of ethyl alcohol-gols. (281,062.)

*32,429 (1927). I.-G. Farbenind. Manufacture of arseno-benziminazolones. (281,690.)

*32,567 (1927). I.-G. Farbenind. Manufacture of benziminazolone-arsinic acids. (281,703.)

XXI.—Applications

Robertson. Photographic films for colour photography. 32,805. Dec. 5.

Vilaseca. Photographic plates. 33,364. Dec. 9.

XXI.—Complete Specification

*32,473 (1927). Zippermayr. Hardening and drying colloids, particularly photographic layers. (281,700.)

XXII.—Application

Rakowitzky and Rakowitzky. Manufacture of matches. 33,209. Dec. 8. (Austria, 15.4.27.)

XXII.—Applications

Paterson. Purification of water. 33,388. Dec. 9.

Prüss. Artificially heating sludge-digestion chambers. 33,221. Dec. 8.

XXIII.—Complete Specification

13,772 (1927). Prüss. Accelerating sludge digestion for sewage treatment. (281,541.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*British India*: Brass foundry, galvanised tinned and aluminium hollow-ware (483); Soap, varnish, paint (484); Surgical appliances (486); Glass bottles, cranes (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Canada*: Iron, steel, metals (8276/27). *Chile*: China-ware, waterproof cloth (501). *Cyprus*: Chemical manures (489). *New Zealand*: Bituminous tape (B.X. 4067); Paper (B.X. 4061). *South Africa*: China, crockery (491); Rolled mild steel bars (A.X. 5631); Boiler tubes (A.X. 5644).

Dyestuffs (Import Regulation) Act, 1920

The following statement relating to applications for licences under the Dyestuffs (Import Regulation) Act, 1920, made during November, has been furnished to the Board of Trade by the Dyestuffs Advisory Licensing Committee. The total number of applications received during the month was 762, of which 639 were from merchants or importers. To these should be added 33 cases outstanding on October 31, making a total for the month of 795. These were dealt with as follows:—Granted, 693; referred to British makers of similar products, 70; referred to reparation supplies available, 2; outstanding on November 30, 30. Of the total of 795 applications received, 728, or 88%, were dealt with within seven days of receipt.

Merchandise Marks Act

The Board of Trade has referred to the Standing Committee appointed by it under the Act, applications for Orders in Council to require the marking of *inter alia* imported copper plates, sheets, and strips, and copper wire; sheet lead and lead pipes.

New Spring Shades

"Fashionable Shades for Spring, 1928," is the title of the latest pattern card issued by the British Dyestuffs Corporation, Ltd. These shades include the following:—Gazelle, D.O. 49; Blush Rose, D.O. 50; Mavis, D.O. 51; Maize, D.O. 52; Passion Flower, D.O. 53; Chestnut, D.O. 54; Bluettes, D.O. 55; Puritan, D.O. 56; Atlantic, D.O. 57; and Zulu, D.O. 58. Recipes for the various colours are given, and it is stated that recipes for matching other shades will be supplied on request.

High Temperature Insulation

It is well known that there are important heat losses due to radiation and convection from boiler settings, furnace walls and other heated equipment, losses that have become still more important on account of modern developments in the use of high temperatures far above that of steam. How these losses can be reduced is discussed in an interesting brochure, compiled by the Celite Products Co., which deals with the question of high-temperature insulation from a chemical engineering standpoint. Data are given to show that an insulating brick prepared from diatomaceous silica is about ten times as effective in retarding the passage of heat as a representative refractory material. Methods are given for determining the rate of heat flow by conduction through walls composed of materials of varying conductivities, and figures are quoted which indicate that without increasing the thickness of the wall, but by replacing parts of the thickness with "Sil-o-Cel" insulating brick, the heat loss was reduced by over 70%. A number of applications of high-temperature insulation is described in the brochure, copies of which can be obtained from the Celite Products Corporation, Windsor House, 46, Victoria Street, London, S.W.1.

News from Advertisements

The Senate of the University of London invites applications for the Ramsay Memorial Chair of Chemical Engineering tenable at University College (p. vi).

A chemist is wanted for textile process work (p. vi).

A chemical library requires a lady assistant (p. vi).

Various sets of the JOURNAL etc. are required (p. vi).

There are now 129 firms represented in our Buyers' Guide.

VOL. 46 NEW SERIES

LONDON, DECEMBER 30, 1927

No. 52

EDITORIAL

Our New Year's Greeting

WE are glad to wish all our readers a very happy and prosperous New Year and to assure them that they have every reason to be proud of the present state of chemistry, of the chemical industry, of the Society of Chemical Industry, and in particular of its JOURNAL. We are firmly of opinion that our readers will have a happy and prosperous New Year. to begin with, all our readers are a year older than they were last year, and about ninety-eight per cent. of so highly educated people as our readers get automatically happier as they grow older. No one has so many bitter sorrows as the young infant. the desire for food, a sense of boredom, an ungratified wish, or an uncomfortable garment causes a degree of acute misery which is heart-rending, and has even been known to distress the mother and the other less important members of the household. The schoolboy and the schoolgirl are far happier, for they feel they are well on the road to that almost divine state of being grown up and having the power of doing as they like. Even the young people of the age of twenty or twenty-five have periods of acute misery; they are—or, at any rate, used to be—afflicted by shyness, love, toothache, examinations, and spots on the face. they are continually striving to be more beautiful, more accomplished, and more athletic than Nature intended them to be; this involves them in a series of grievous disappointments. The middle-aged, by which we mean those who are between forty and sixty, are free from most of these disappointments: towards the latter end of that period, for it has two ends, they view with complacency the frost, for it enables them to clean their skates and talk of the pleasure of doing the outside edge and cutting eights, and with equal complacency the thaw, because it saves them a cold journey in the train and the trouble and expense of buying a new pair of boots; they get almost greater pleasure out of a game of bridge, and are prepared to go three no trumps on two kings and a couple of martinis, hoping for the best as only the mature and experienced can do. We know some oldish people, about eighty, who are as happy as kings and almost as autocratic; one of them plays a very good game of snooker, and not only scores off us with the cue, but also by his reminiscences of the opera and the theatre in the 'sixties and 'seventies; another

oldish man gets far more satisfaction out of a few score of wooden blocks cut by a yet older man—and accurately cut, mark you into rhombic dodecahedra than any young child gets out of an equal number of wooden bricks. These two oldish men have more spare time, more experience, and more imagination than those of a younger generation, and they simply revel in the possibilities of this new chemical implement: whether it will prove to be comparable with Newton's pet calculus or Tait's pet quaternions or Moseley's pet X-rays no one can say; that is not part of our theme, which is of happiness merely. Secondly, let us deal with prosperity; this is possible to everyone who really, with all his soul, desires it, and it is, moreover, the only hobby which all may be successful in pursuing. There are two ways of obtaining it—one by increasing your income, the other by decreasing your expenditure. The chemist may easily do the latter: he has only to give up all the foolish luxuries of this life and devote himself to study and he will find that every hour he spends in reading will save him fivepence or sixpence, according to his habits, when he is not so engaged. It is a noble thought to indulge in, after perusing a solid treatise on allotropy or crystallography, that you have not only mastered the subject, but are also a guinea in hand. Read as we may, we cannot keep pace with the growth of chemistry; it advances so fast and from so many points, and in so many directions. Herein, also, the man or woman who is philosophically minded may find cause for happiness. If you come to think it out, although you cannot read all that is written, you can, by about the time you are sixty, read pretty nearly all the books that are worth reading. Few books are worth reading that are not worth keeping, and the total number of books worth keeping, not as curiosities, investments or articles of furniture, is only about fifteen hundred. If a reader has discrimination and reads the best twenty books in Greek, and the best twenty in Latin, all the rest may go hang. Probably thirty or forty of the best books in French and German will suffice for most English readers; and as for chemical books to read, the number is small, too small. We wish a few of our readers would give us a list of the best fifty books on chemistry which a chemist may read for pleasure. We think we are right in thinking that a

chemist may, long before he gets into a stage of senile decay, read all that is worth reading in his own subject and several other subjects too. All that is required is a sufficiently high standard of literature. We thought we should have space to show causes for happiness in contemplating our industry, our Society and our JOURNAL, but these are so many and so obvious that it cannot be done. Here again we see the advantage of middle age; neither we nor our readers feel any sense of disappointment. We know, however, one cause of satisfaction that some of our readers do not: the prudent conduct of the Council of the Society has resulted in a state of financial prosperity which in the fullness of time will be apparent: let us gloat over this, until finally the auditors will tell us whether the margin is fifty or seventy-five pounds, and whether it is on the credit or the debit side of the account. As for the JOURNAL, we think it will maintain its high standard: the solid part is almost incapable of improvement: the ephemeral part we intend to improve, and we have every intention during the New Year of curbing that editorial flippancy which on three occasions during 1927 has been apparent. Our good wishes to you all!

Electro Magnetic Radiation

It was in the year of the Great Fire of London that our worthy Newton discovered the spectrum of visible light, but radiological research—that is, the study of electro-magnetic radiations—cannot be said to have commenced in real earnest until towards the close of the eighteenth century, when Scheele discovered the action of rays existing beyond the violet end of the visual spectrum by means of a sensitive plate. The Crookes tube was invented in 1879, and the experimental work and hypotheses which this discovery stimulated were crowned in 1895 by Röntgen's discovery of X-rays. In the past two decades much work has been carried out upon those rays which exist in the ultra-violet part of the spectrum, and, if it is not invidious to mention a single name in connexion with electro-magnetic radiation research so ably pursued by many investigators, we may commend the papers of Milliken to those who wish to delve deep.

We wrote recently that the physicist might soon discover a terrible "death ray," and we implied that the abuse of scientific discovery provided no adequate reason for the suppression of radiological research, since much of value to mankind would on this event remain undisclosed. We hope in this short note to show that the ultra-violet rays, the X-rays and other electro-magnetic radiations are in reality already being applied to the service of man.

In order to visualise a clear picture of the wide range of radiations, we consulted a chart published by the Royal Society, and we think it not amiss to traverse with our readers the range of electro-magnetic vibrations. The rays of shortest wave-length are the gamma rays emitted by radium—one three hundred millionth of an inch—whilst the longest, thirty miles in length, are given out by alternating current machines. Between these extremes lie the "wireless" waves, the heat rays, the infra-red Herzian rays, the light rays of the visual spectrum, the ultra violet rays, the X-rays and other regions, some comparatively little explored. X-rays

and those ultra-violet rays emitted by our modern lamps are coming to be applied in many directions in industry and medicine. Thus, it is not long since we published a paper by A. A. King dealing with the application of the ultra-violet rays in the detection of minute amounts of arsenic. It was found that absorption of the rays by the mercury-arsenic stain, suitably produced and exposed to the ultra-violet rays, makes it intensely black, so that stains which are quite indistinguishable in ordinary light stand out markedly upon a fluorescent background. Quantities of arsenic as small as 0.00000005 gm. have been estimated, and even smaller amounts have been detected qualitatively.

But we were inspired to look into the matter of electro-magnetic vibrations more by the appearance of a book by Pullin and Wiltshire, of the Research Department, Woolwich Arsenal, entitled "X-rays, Past and Present." With much that the authors say about the presentation of scientific knowledge and discovery to the lay reader we are in firm accord, and we ourselves have tried in the past to plead for accurate, simple expositions from the pens of those qualified to write—and only those—upon matters of fundamental import. Of this we must say no more at present. "X-rays, Past and Present" gives readable accounts of "The Nature of Visible Light," "Weighing the Electron," "X-rays and the Atom" and "X-rays and Crystals," whilst the application of X-ray spectroscopy is given adequate treatment.

We believe that X-rays have not yet been properly appreciated by the practical metallurgist: by means of X-rays flaws can readily be detected in large castings or in welded joints, but this method is not yet duly employed. With a fore-knowledge of such flaws, much money might be saved, for unnecessary expenditure upon metal working could be avoided, whilst even more danger to human lives might be minimised. How often do accidents upon land and in the air occur by reason of faulty structural materials, faulty in a way perhaps only detectable by means of the X-ray!

Pullin and Wiltshire tell us, in addition, that glued wood joints are best inspected by means of X-rays, that these rays may be used to detect impurities in foodstuffs, to discover pearls in oysters and to determine the perfection of insulation of electric cables. Moreover, actual analysis of materials by means of X-rays is possible, and the writers look forward to the greater application of X-ray analysis.

The applications of X-rays and ultra-violet rays are already with us, and the technique of using such radiations is rapidly becoming simplified, so that the immediate future may see important developments. What will come when the unexplored region of the spectrum between the shortest ultra-violet ray and the longest X-ray has been made to yield its secrets it is impossible to say. We are content to know of the above practical uses of rays, of the value of X-rays in surgery and the treatment of disease, of the production of vitamins by the irradiation of ergosterol with ultra-violet light, and of the results of the tanning of the "wireless" waves which, strangely enough, are to bring to us almost at this very moment a lecture which we could not otherwise have heard. Light is life, but other electro-magnetic vibrations will afford us a life undreamed of by old Newton.

W. J. MÜLLER'S WORK AND VIEWS ON PASSIVITY

U. R. EVANS

In his famous letter addressed to Faraday in 1830 Schoenbein¹ described iron as being "indifferent or passive" when it failed to react with nitric acid of sp. gr. 1.35. Other early investigators employed the word "passivity" in a similar sense, to denote the condition in which the metal showed no reaction or only a slow reaction with solutions that normally would attack it readily. Gradually, however, the use of the word has changed. Faraday himself,² in his reply to Schoenbein, pointed out that the entry of iron into the passive condition is promoted by contact with "platinum wire"—that is, by making the iron the anode of a cell. Later workers found it convenient to apply this anodic treatment by means of a current supplied externally from a battery. It was found, for instance, that in many solutions an iron anode dissolved quantitatively at low current densities to give a soluble ferrous salt, but that when the current density was raised the metal soon became passive, after which nearly all the current passing was devoted to the production of oxygen. Fredenhagen³ pointed out that the passage of iron into the passive state was accompanied by a sudden rise in the electrode potential, and it gradually became natural to associate the passivity of iron with an abnormally high potential, similar to that shown by noble metals. It became evident also that other metals besides iron were capable of existing in two separate "conditions," associated respectively with low and high potentials—but it appeared that in some cases the metal was able to pass freely into solution in both conditions, although different substances were produced according to the condition. Indeed, as early as 1898, Hittorf⁴ had stated that chromium existed in three conditions, in one condition it passed into solution as a blue chromous salt (with chromium divalent), in a second condition it was supposed to produce a chromic salt (with chromium trivalent),⁵ and in the third it yielded yellow chromic acid or a chromate (with chromium hexavalent). In view of various analogies between the "conditions" of chromium and the "conditions" of iron, it was inevitable that electrochemists should begin to refer to chromium as "passive" when it was dissolving to give chromates, and thus we have arrived at a usage in which the term "passivity" does not indicate a condition of "inertness," but rather "dissolution in an abnormal manner." In late years this usage—far wider than the original sense in which the word was employed by Schoenbein—has been extended to iron also; thus, Müller⁶ talks of iron dissolving (in hydrochloric acid) as ferrous chloride when active, and as ferric chloride when passive.

There is no doubt that whilst to the ordinary chemist the word "passivity" still calls up the idea of chemical

inertness or at least of *sluggish reaction*, the average electrochemist regards an *abnormally high potential* as the really entertaining feature of passivity. But since—as we have seen with chromium—a high potential, does not necessarily imply sluggish reaction, it is clear that the explanation of the chemical inertness is not quite the same as that of the elevated potential, although no doubt the two phenomena are often closely connected. It is inevitable, therefore, that the "theories of passivity" as put forward by chemists and electrochemists will at first sight appear to conflict, since their authors are using the word in different senses: but this apparent divergence of opinion disappears in part (unfortunately only in part) when the rival statements are translated into a single system of terminology.

For instance, the views of W. J. Müller, based on electrochemical research, may at first sight appear to be quite irreconcilable with the opinions based on recent chemical work in this country. But when they are closely studied it is found that the essential part of Müller's theory is the explanation of the potential rise, and this portion of the theory will be found capable of being accepted by many of those who still regard his explanation of the slow dissolution of passive iron as unconvincing. But whether Müller's theories are accepted or rejected, his experiments have contributed so much to our knowledge of the subject that a short account of his results may be of value to those in this country who are unacquainted with them. It is for that reason that this article is being written.

One of the difficulties in studying the production of passivity by anodic treatment has been the lack of reproducibility in the results. Müller has succeeded in finding the chief causes of these irregularities, and eliminating them. When a vertical electrode is subjected to anodic treatment, the heavy metallic salts formed sink down the electrode surface, producing convection currents which are very difficult to control; since, as Müller showed, the production of passivity by anodic treatment depends on the accumulation of the anodic product in the layer next to the metal, it is inevitable that there must be discordance between the setting in of passivity in different experiments. Müller⁷ has overcome the trouble by using a horizontal anodic surface. In his apparatus the anode consists of a metal cylinder with its flat top uppermost and exposed to the solution, all its other sides being protected from the solution by glass; the anode surface is further protected from stirring in the main body of the liquid by means of a glass hood. This arrangement allows the layer of heavy liquid produced over the anode surface to remain there undisturbed by any convection phenomena.

Using this apparatus, Müller⁸ found that when iron is subjected to anodic treatment in *N*-sulphuric acid at low current density, it passes into solution as ferrous sulphate at a potential of about 0.2 volt (hydrogen scale). Even at high current densities this dissolution as ferrous sulphate at about —0.2 volt takes place freely at first: but, after a certain time, a quick rise in the potential, accompanied by a decrease in the

⁴ Z. Phys. Chem., 1908, 25, 729.

⁵ There is now some reason to believe that under ordinary conditions the formation of chromic salts is a secondary reaction; chromous salts are first formed, and are either oxidised or become decomposed, giving chromic salts and hydrogen.

⁶ Z. Elektrochem., 1924, 30, 414.

⁸ Monatshefte für Chemie, 1927, 48, 65.

current density, occurs, as indicated by the broken lines in the diagram. After this change, the iron anode is passive both in the chemical and electrochemical senses; the potential is abnormally high (+0.6 to +2.0 volts) and the iron has practically ceased to dissolve. If the total E.M.F. applied to the cell is sufficient, current may continue to flow, but it will now be devoted mainly to the production of oxygen, the anodic potential having risen sufficiently to make this possible. Oxygen is freely evolved if the anode potential reaches about +2.0 volts; but if the anodic potential only reaches about +1.0 volts, practically no current passes at all. On breaking the circuit, and touching the iron with zinc wire, the iron again becomes active; the whole experiment may then be repeated, the time needed to produce passivity being the same as before, provided the current density and other conditions remain the same.

The interesting feature of this work is that the time during which the current must flow before the sudden

the case of chromium. The matter is further complicated by the fact that the chromous salt produced over the anode surface decomposes spontaneously to yield hydrogen gas and a chromic salt, which in turn tends to hydrolyse to give chromic hydroxide, or perhaps a basic salt; this hydrolysis is possible because the migration of cations away from the anode leaves the surface layer next to the anode denuded of hydrogen ions.

The fact that passivity can be produced equally well by a short application of a high current, or by a long application of a low current, rather suggests that a quantity of some substance must accumulate at the anode surface before passivity can set in; this idea is well in accord with the observations of Alvares,¹² who found that a much higher current density was needed to produce passivity on a rotating iron anode than was required to render passive a stationary anode. Müller's view,¹³ for which he is able to furnish good experimental support, is that some substance must accumulate until the solution becomes supersaturated and a solid is deposited on the

Curves connecting current (in milliamperes) with anode potential (hydrogen scale) for iron, nickel, and chromium in sulphuric acid solution. Active values shown in Squares. Passive values shown in Circles. Transition to passive conditions shown as Broken Lines.

change to the passive condition sets in depends on the current density. The times are shown in the diagram by the numbers placed above the broken lines. It will be noticed that a fairly small current density working for a long time can produce the result just as surely as a high current density working for a short time. A rather similar state of affairs was found by Müller⁹ to be true of a nickel anode immersed in normal sulphuric acid (previously saturated with nickel sulphate to diminish diffusion), although here the curves are of a slightly different form,¹⁰ and the matter is complicated by the occurrence of pulsations. Chromium also behaves in a manner analogous to iron, but the times needed for the production of passivity are much smaller with chromium than with iron: Müller and Noack¹¹ found it necessary to use an oscillograph to obtain the measurements in

anode; when this deposition on the anode has occurred, a large part of the electrodic surface will be covered up, and since the current flowing is concentrated on the small fraction remaining uncovered, the "effective" current density at this portion increases, perhaps to 100 or 1000 times the original value; as a necessary consequence of this rise in current density, the anode potential must rise, until a value is finally reached which renders possible the reactions characteristic of the passive state.

The composition of the deposit responsible for the change varies in different cases. According to Müller, the deposit produced on iron anodically treated in a sulphate solution is probably ferrous sulphate,¹⁴ whilst that produced on chromium is usually a basic chromic salt, or even chromic hydroxide.¹⁵ It is not maintained by any one that this deposit causes passivity by acting as a protective sheath to the metal. Müller particularly points out that the deposit formed on an iron anode during—or just previous to—the entry into the passive

⁹ Monatshefte, 1927, 48, 559.

¹⁰ For instance, there is an appreciable rise in the potential with the current density before the occurrence of the sudden rise which accompanies the transition to the passive state; thus the potential of nickel may become "nobler" than that of hydrogen as a result of ordinary polarisation, without the nickel becoming definitely passive; this, Müller thinks, may be the reason why nickel produces hydrogen so slowly at ordinary temperatures when placed in dilute acids.

condition completely vanishes when once the electrode has become passive; these visible deposits are conducive to the *assumption* of the passive condition, but are not responsible for its *maintenance*. This is shown particularly clearly by the well-known work of Hedges¹⁶ on anodic periodicity. Iron anodically treated in 10% sulphuric acid at a current density of 420 m.a./cm.² showed oscillations between the active and passive conditions, the period being 40 sec. The electrode acquired a dull grey film during the active intervals, but each time passivity set in, the film peeled off and dissolved in the solution, the anode remaining quite lustrous during the passive intervals.

Müller's idea that the formation of a deposit on the electrode surface raises the effective current density on the exposed portions seems entirely reasonable as an explanation of the rise of potential—that is, as an explanation of passivity in the *electrical* sense of the word. It does not in itself explain the fact that the metal, having reached the high potential, almost ceases to dissolve—the fact which is mainly of interest to the *chemist*. Müller's views on this subject¹⁷ may be summarised as follows:—At the surface of a metal which normally goes into solution at a low valency, an equilibrium exists between free (or virtually free) electrons and metallic ions. When the metal is dissolving in the active state, metallic ions of low valency can be supplied, as it were, "ready-made," as fast as they are required; but if the effective current density at a point becomes too high (owing to the screening action of the deposit explained above), the high potential alters the condition of the metal in the surface layers, and the metal either ceases to dissolve altogether, or commences to dissolve as ions of a higher valency.

This theory, which has much in common with that of Smits,¹⁸ appears only to be applicable to metal rendered passive by anodic treatment. It does not tell us, for instance, why pure iron can be rendered inert towards copper nitrate simply by exposure to dry air. This and similar facts are easily explained on the view that the surface layers of the metal are converted into oxide, which when once it has become continuous over the surface and has ceased to develop cracks, protects the underlying metal from the action of the reagent. The author's recent studies of the films removed from the metal have indicated that this is the correct explanation.¹⁹ The film is invisible whilst it is in union with the metal, since such films are always invisible unless they possess the thickness needed to give interference colours. Müller, however, opposes the view that passivity (in the chemical sense) is due to a protective skin. He bases his objection on some careful optical work performed by himself and Koenigsberger²⁰ over twenty years ago, when they showed that the reflecting power of iron was not appreciably altered when it passed from the active into the passive state. It is impossible to describe this work here, or to discuss the criticisms of

Ruer,²¹ Siedentopf,²² Haber and Maitland,²³ Krassa,²⁴ Manchot,²⁵ and others. Indeed, it is not really necessary to enter into the optical side of the controversy, since recent work has indicated that a *discontinuous* film exists even on *active* iron (if it has been exposed to the air or to dissolved oxygen), and that the process of passivation consists in repairing the discontinuities of this film sufficiently to exclude the most penetrating ion or molecule present.

Thus, whilst Müller's views on the cause of the rise in electrode potential may be accepted, at least provisionally, it is difficult to feel satisfied with his views as to the cause of the chemical inertness which is—to most chemists—the interesting feature of the passive condition. Considering Müller's work along with other recent work on passivity, the following appears to be a reasonable attitude to adopt.

Three different types of reactions are theoretically possible at an anode:—

- (1) The production of a soluble salt of the metal composing the anode.
- (2) The production of an oxide of the metal.
- (3) The evolution of oxygen gas.

In general, the first reaction involves least expenditure of energy, and will occur at the lowest anode potential; the second requires rather more energy, and can only take place when the potential is raised somewhat; the third calls for most energy of all, and requires a highly elevated potential.

Consider now an iron anode in a sulphate solution. When current passes, the iron dissolves as soluble ferrous sulphate, because the potential will not—at any ordinary current density—rise high enough for reactions of type (2) and (3). But sooner or later the layer of liquid next to the anode will become supersaturated with ferrous sulphate (or perhaps with some hydrolysis-product) and a solid deposit will be precipitated on the anode surface, covering up a large fraction of the area. This layer, *deposited on* the iron, will frequently be *visible*, but will *not* be protective, since it is discontinuous; it will, however, serve to increase the effective current density on the points not covered up, and hence—as Müller has suggested—the potential will rise at these points. Reactions of type 2 will then become possible, and sooner or later the surface portion of the metal will become transformed to oxide; this oxide-film formed *in situ* (in contradistinction to the layer previously deposited from without) will be *invisible* and will have *protective* value, hindering the iron below from passing into solution as ferrous salt. It will also soon begin to protect the iron below from further conversion into oxide, but the conversion of iron into oxide may gradually extend sideways, as the layer of ferrous sulphate gradually passes into solution (since the production of fresh ferrous sulphate has now ceased, diffusion will permit of a slow removal of the solid ferrous sulphate already present). Finally the whole surface layer of the metal is converted to a

²⁵ Ber., 1909, 42, 3042.

continuous layer of oxide, the surface being now clear of visible deposit. At this stage, the only possible reaction is that of type (3), and if the E.M.F. applied to the cell is sufficient to furnish the necessary high anodic potential, the current will continue to flow, but it will be devoted to the production of oxygen gas. If now the current is stopped, the electrode, being sheathed with oxide, will not show the reactions of active iron, and being supersaturated with oxygen gas will show a very high potential, although this will fall off with the time.

•With chromium the state of affairs is modified by the fact that the highest oxide is freely soluble. Hence, even after the deposition of the layer of chromic hydroxide—postulated by Müller—has raised the effective current density and thus the anode potential, the metal continues to dissolve as yellow chromic acid, and no oxygen is evolved. After turning off the current, the electrode is free from any continuous insoluble film, and consequently the potential at once drops to a value which is usually more negative than the value before the anodic treatment. This drop is well shown by the curves published by Aten.²⁶

NEW BRITISH SHORT FLAME BURNER FOR PULVERISED FUEL

One of the objections to the otherwise highly efficient principle of pulverised fuel firing has been the great length of the flame which, for example, is about 30 ft. with large water-tube boilers in land practice, having a row of burners of the usual type pointing downwards. As a result a combustion chamber, say 50 ft. deep, is necessary, with a very high overall setting of 100–120 ft. from the ground level. A new British burner on the turbulent principle has been designed which represents a notable advance, as it enables combustion with pulverised fuel to be complete in about 10 ft. only. As a result the combustion chamber volume of a water-tube boiler can be cut down by half, a great saving in capital cost, whilst the burner takes oil fuel or gas equally well, and the possibilities for cylindrical boilers and general furnace work, in the chemical and other industries, are important items. A single burner will take up to 150,000,000 B.Th.U., 5–6 tons of coal per hour, so that instead of 10–12 burners for a very large water-tube boiler of 200,000 lb. per hour evaporation, only 2–4 are necessary. The design is the result of extended investigations by the research staff of Messrs. International Combustion, Ltd., of London, and the perfected burner, which has been operated at Barrow continuously for a number of months past, is to be fitted on a number of plants, including the new Hams Hall power station at Birmingham. A solution is also claimed for other difficult problems in turbulent burner design, such as "stratification" troubles at the burner tip, absence of complicated parts, one simple adjustment only, and ability to stand the heat.

The details of the design are shown in the illustration. In general 15% of the total volume of the air, at the low pressure of only about 2" W.G., is supplied directly round

the centre of the burner, along with all the coal, by means of a concentric casing, while 85% of the total volume, as secondary air, enters in another concentric casing at 1" W.G. behind the first casing. This secondary air is given a violent cyclonic motion in addition to that of the primary air and fuel, by means of spiral ribs, so that separation of air and coal particles at the burner

tip is impossible irrespective of what happens in the primary air circuit on the way. The number of separate parts is very small, and the only adjustment necessary is a single slide damper on the secondary air supply pipe, although hitherto turbulent burners have been largely dependent on the personal skill of the operator, with constant adjustment necessary to suit varying steam demands.

THE "A" TUBE AN IMPROVED FORM OF "U" TUBE

By A. O. JONES and F. HOBSON

The ordinary U-tube has two serious disadvantages, the chief being the ease with which it is broken by slight pressure or tension exerted on its limbs in the same direction as the plane of the tube. The other is the fact that the bend often becomes choked with solid caked material, difficult to remove, and at which impatient students are prone to pick with wire or glass rod, to the detriment of the tube.

It has been the experience of both authors to see many U-tubes thus broken, more especially perhaps by elementary students; and it was with a desire to avoid such mishaps that the authors, independently of each other, devised the A form of tube shown in the sketch given.

It has several advantages over the usual U-tube. It is easily made, filled and cleaned, not being likely

²⁶ Proc. R. Akad. Wetensch. Amsterdam (English version), 1918, 20, 1121. Aten would probably not interpret his results in the way suggested above.

to break even when caked solid in the limbs is picked at with a rod, and has great mechanical resistance to crushing in the hands owing to the shoulders being in contact at B; whilst wiring of the bends together at A makes it impossible to pull the tube apart with the exertion of any ordinary force. A minor advantage is that it can be more easily clamped by the cross tube, with less likelihood of breakage than the ordinary U-tube can be by the bend. When filling, material should be prevented from entering the cross tube by inserting plugs of asbestos or glass wool.

An obvious disadvantage is present in the dead spaces below the cross tube, but these can be easily minimised, and are of no consequence in elementary work and may

An improved form of "U" tube

sometimes be of advantage, permitting for instance, the collection of liquid without interference with the flow of gas.

In the form supplied with taps, these are put on at right angles to the plane of the tube so as to permit it to be used upside down if necessary without the plugs falling out.

The tube can be obtained from Messrs. Gallenkamp not only in the simple form here depicted, but also with taps on the side tubes, and in lighter, smaller sizes with longer legs which can be sealed off after filling for combustion work.

SOCIETY OF CHEMICAL INDUSTRY OFFICIAL NOTICES

SUPPLY OF JOURNAL TO MEMBERS

It has been arranged that all Members of the Society shall be supplied with the issues of the JOURNAL for January irrespective of whether their subscriptions for 1928 have been received or not. Those who have not yet remitted the amount to the Society's offices are recommended to do so as soon as possible, in order to ensure that the issues subsequent to that for January 27 are despatched to them on publication.

BINDING CASES FOR BRITISH CHEMICAL ABSTRACTS AND JOINT INDEX

Abstracts "B" and Index to "A" and "B"

Binding cases for the above publications, in dark blue cloth, will be available, commencing with the 1927 issues.

The price will be 3s. 9d. per set of two cases, postage 6d. extra, or, separately, 2s., postage 3d. extra.

Abstracts "A" and Index to "A" and "B"

Cases are also available in maroon or blue cloth, price 3s. 9d. per set of two cases, postage 6d. extra.

Orders, accompanied with remittance, should be forwarded to Messrs. Gurney & Jackson, 33, Paternoster Row, London, E.C.4.

COAL CLEANING CONFERENCE

Copies of reprint of the papers read at the Coal Cleaning Conference held in Edinburgh in July, with the discussion thereon, are still obtainable.

The reprints are in JOURNAL format, with paper cover, and the price is 2s. 6d. net and post free.

Orders, accompanied by the appropriate remittance, should be sent to the General Secretary at the Society's Offices, Central House, Finsbury Square, London, E.C.2.

SUSPENSION OF ENTRANCE FEE

The Council has decided to continue the suspension of the Entrance Fee during the year 1928.

ABSTRACTS IN APPLIED CHEMISTRY

It has been arranged to supply members of the Society with reprints of the Abstracts of Applied Chemistry, printed on one side of the paper only, at the price of £1 for the year 1928.

Applications for these, accompanied by the appropriate remittance, should reach the General Secretary at once.

CHEMICAL SOCIETY'S LIBRARY

Members of the Society of Chemical Industry are reminded that they are entitled to consult the Library of the Chemical Society, Burlington House, Piccadilly, W.1, and to borrow books therefrom.

The Library is open daily from 10 a.m. to 9 p.m. Saturdays from 10 a.m. to 5 p.m. The Library is closed on Bank Holidays, the day following, and on such other occasions as the Council may direct.

ROTHAMSTED LIBRARY

By the courtesy of the Lawes Agricultural Trust, any member of the Society of Chemical Industry, on present-

ing a card from the General Secretary, shall be allowed access to this Library. The rules of the Library preclude journals and periodicals from being sent out, and these are, therefore, always accessible.

A catalogue of the journals and periodicals is in the Society's Offices at Central House, and may be consulted there by members.

CALENDAR OF FORTHCOMING EVENTS

Jan. 2.—Society of Chemical Industry, London Section. Chemical Society's Rooms, Burlington House, Piccadilly, W.1, at 8 p.m. "Future of biochemical research," by Dr. J. C. Drummond.

Jan. 2.—Institution of the Rubber Industry, London and District Section. Engineers' Club, Coventry Street, W.1. "Synthetic resins," by A. A. Drummond.

Jan. 5.—Institution of Mechanical Engineers, Manchester Meeting. "Cutting temperatures: their effect on tools and on materials subjected to work," by E. G. Herbert.

Jan. 5.—Institution of Electrical Engineers, Ordinary Meeting. Savoy Place, Victoria Embankment, W.C.2, at 5.30 p.m. "Storage batteries in relation to modern supply of electric lighting and power," by E. C. McKinnon.

Jan. 5.—Society of Chemical Industry, Bristol Section. Joint meeting with the Chemical Society. The University, Woodland Road, Bristol, at 7.30 p.m. "The catalytic oxidation of aromatic hydrocarbons and their derivatives by means of air," by Dr. E. B. Maxted.

Jan. 6.—Society of Chemical Industry, Manchester Section. Engineers' Club, 17, Albert Square, Manchester. "Action of caustic alkali on partially-methylated cellulose—the heat of reaction and absorption," by F. C. Wood and Agnes C. Alexander.

Jan. 7.—Manchester Literary and Philosophical Society, Chemical Section. Soirée, 36, George Street, Manchester, at 7 p.m.

Jan. 7.—Western Junior Gas Association. Visit to the works of the Bath Gaslight & Coke Co. Papers as follows:—(1) "Some notes on water softeners and water softening," by W. L. Ashmun. (2) "Future of the gas engine," by H. C. Feltham.

Jan. 9.—Institute of Metals, Scottish Local Section. 30, Elmbank Crescent, Glasgow, at 7.30 p.m. Open discussion. Various subjects.

Jan. 9.—Institute of Chemistry, Manchester and District Section. Manchester Limited, Royal Exchange Buildings, St. Ann's Square, Manchester. "Some inter-relations of chemistry and physiology," by Prof. H. S. Raper.

Jan. 10.—Institution of the Rubber Industry, Meeting of Liverpool Section, at the Common Hall, Hackins Hey, Dale Street, Liverpool.

Jan. 10, 11 and 12.—Annual Exhibition of Scientific Apparatus, Imperial College of Science and Technology, South Kensington, S.W.7.

Jan. 10.—Institution of Petroleum Technologists. General Meeting. House of the Royal Society of Arts, John Street, Adelphi, W.C.2, at 5.30 p.m.

Jan. 11.—Society of Chemical Industry, Nottingham Section. "Action of acids on wool," by S. R. and E. R. Trotman and J. Brown.

Jan. 12.—Institution of the Rubber Industry, Birmingham and District Section. Grand Hotel, Birmingham. "India-rubber as an auxiliary to suspension," by F. W. Lancheater.

Jan. 13.—Institute of Chemistry, Liverpool and North-Western Section. Jubilee celebrations. Dinner at Adelphi Hotel, Liverpool, at 7.30 p.m.

CERAMIC SOCIETY

The autumn meeting of the Refractory Materials Section was held in Bournemouth on September 26 and 27, being the opening meeting of the Clay Convention. The chair was occupied by the President of the Society, Mr. H. J. C. Johnston, who was also the President of the Convention.

The first contribution, by A. T. Green, was entitled "A consideration of open-hearth steel works' refractories." A general description was given of the construction and working of an open-hearth steel furnace, including the regenerators. In the taking up of heat by the refractories of the regenerator chambers, and then imparting it to the air, only to a distance of one inch from the exposed surface does the material take part in heat-transmission. The heat losses from the regenerators amount to 16% of the total heat losses of the steel plant, which is excessive when it is noted that the thermal efficiency of the open-hearth process is only about 17%. Insertion of an insulating wall between the outer red brick wall and the inner lining should serve to minimise these losses. Wear and tear on refractories would be lessened if the air and producer gas be properly mixed at the right places and projected so that no very hot flames strike certain portions of the brickwork. These conditions being strictly adhered to, it should be possible to work at higher temperatures than at present, using the normal silica bricks. The author, after a consideration of the texture of silica bricks used in steel furnaces, came to the conclusion that it is advisable to compromise and have a product of specific gravity about 2.42, with increased resistance to spalling and corrosion, at a reasonable cost, and make allowances for expansion, rather than to have a very expensive, highly-converted product, with less expansion, but liable to the introduction of spalling strains during the initial heating, a softening at high temperatures, and a liability to excessive corrosion.

A paper on "Silica bricks made without added bond" was given by W. Hugill and W. J. Rees. It was found that, with a suitable grading of the silica rock, including a large proportion of very fine material, the melting of which supplied the matrix, silica bricks could be made by ordinary hand-moulding methods, and fired in a commercial kiln, the strength and other properties being inferior to those of bricks made with added bond. The degree of quartz conversion was greater when no bond was added than in lime-bonded bricks, but in the former the inversion was almost entirely to cristobalite, whilst in the latter tridymite was formed in fair proportion.

R. S. Troop and R. Wheeler described "Some experiments in drying clay." The linear measurement of contraction is not to be relied upon, because, in the preparation of the test pieces, accidental stretching or compressing may cause sufficient distortion to invalidate the measurements made. In order to obviate this source of error it was decided to determine volume contraction instead of linear contraction by the use of a special mercury volumeter designed by S.-R. Hind. In all cases the contraction in the earlier stages of drying is exactly equivalent, in volume, to the water removed from the sample by evaporation, and is very uniform. This continues during what may be termed the "main

contraction" period, at the end of which the rate of contraction changes very suddenly, becoming very small during the "residual contraction." This last extends from the end of the "main contraction" period to the "100° C. dry state." The change from "main contraction" to "residual contraction" in Stourbridge fireclay occurred at a moisture content of 14 to 15.7%, with ball clay at about 12%, and with china clay at about 28%. Whilst between 28 and 11% of moisture a very little contraction occurs in china clay, between 11% and the "dry state" there is actually an expansion which was observed with several different china clays, but with no other kind of clay. Careful tests showed that the minimum volume in china clay occurred with a moisture content of 8 to 10%. The rate of drying had no measurable effect on the total contraction. When the foregoing method is not applicable, Robinson's "plasticene coating method" can be applied to the indirect measurement of contraction of clay. Further experiments on the drying of clays showed that the rate of drying could be greatly accelerated, without risk of distortion, by drying at higher temperatures (up to 70° C. or beyond), providing the humidity of the atmosphere be suitably increased.

A paper by W. C. Hancock and J. G. Cowan, on "The crushing strength of unfired fireclay bodies," was presented by the former. The materials used were a mixture of two Stourbridge pot clays, and hard-fired Stourbridge clay for "grog," which was crushed and sieved to give a fine grade and a coarse grade. The bodies used for these tests were (1) neat clay, (2) 80 clay with 20 fine grog, (3) 80 clay with 20 coarse grog, (4) 60 clay with 40 fine grog, and (5) 60 clay with 40 coarse grog, respectively. The tensile strengths in lb. per sq. in. were respectively 156, 171, 137, 108 and 71 (each the average of five tests). For crushing strength determinations three forms of test piece were used, viz., cylinders 1 in. diameter and 2 in. high, rectangular blocks 2 in. by 1 in. by 1 in., and cubes with 2 in. edges. Results of the tests were given. The figures for the cubes, allowing for amounts and size of grog, were much more consistent than the others. Three types of fracture were observed in the crushed test-pieces, viz., fracture due to "cone" formation, fracture due to (plane) shearing, and fracture due to a combination of the two.

A paper by Dr. A. F. Joseph, Sudan Government chemist, followed, on "The characterisation of clays." In 12 samples of ceramic clays, the mechanical composition of which was given, the finest fraction (less than 0.002 mm.) ranged from 12.8 to 89.8% of the whole. In some cases the plasticity is very different in materials containing practically the same percentage of the finest fraction, and this different behaviour must be ascribed to difference in the nature of the fine fraction. The abbreviated chemical composition, imbibitional water capacity, and molecular ratio of silica to alumina were given for six "clay" separates (the finest fractions) and three typical clays, and it was pointed out that the greater the molecular ratio (silica : alumina) the greater the imbibitional water capacity, and that where this ratio approximated to 2 : 1, as in china clay, this capacity was very low. Researches in the author's laboratory

indicate that the colloid content of a raw material may be taken as identical with its "clay" content.

The last paper was by A. J. Dale, on "The effects of temperature on the mechanical properties of silica products," the term "silica product" being restricted to materials containing more than 92% silica. The experimental results suggested that there are two fairly distinct classes of commercial products, for convenience termed class A bricks and Class B bricks respectively. Conversion during kiln firing of Class A bricks produced mainly cristobalite, but in Class B bricks a considerable proportion of tridymite is present. Three peculiarities are noticeable when testing a Class A silica brick under five different static loadings (75, 50, 30, 18, and 4 lb. per sq. in.). The curves obtained, considered collectively, seem to offer a fairly complete explanation of the causes of failure under stress, thermal and mechanical, at low or high temperatures, of a large class of silica products. The first peculiarity is an accelerated rate of thermal expansion which occurs during the low-temperature range (100° to 350° C. under test conditions). This is attributable to sudden inversions of tridymite and cristobalite. The actual recorded vertical expansions within this temperature range are governed by the magnitude of the applied loading. Generally speaking, the greater the load the less the low-temperature inversion-expansion in the direction of the applied stress. The second peculiarity in these curves is the gradual and increasing difference between the rates of vertical thermal expansion under different loads at temperatures above approx. 900° C. The third peculiarity appears in the final portions of the curves, especially when comparing the 75 lb. and 4 lb. test results. Between 1450° and 1500° C., and onwards, the test-piece under a 4 lb. per sq. in. loading shows an increasing rate of "thermal expansion" (short for "vertical thermal expansion under load"), whereas under a 75 lb. per sq. in. loading, "thermal expansion" is retarded at about the same temperature (1480° C.) as it was accelerated under the 4 lb. per sq. in. stress.

Considering jointly the five curves, it can be concluded that under the imposed conditions (of test), the higher the load the less the low-temperature and high-temperature local expansions, and also the lower the temperature at which vertical expansion ceases.

METALLURGY IN CANADA

Apart from the Rouyn developments in N.W. Quebec, the greatest interest in eastern Canada is centred in the Froid Mine and the Froid Extension, respectively owned by the International and the Mond-Nickel Companies. It is estimated that the Froid Mine of the International contains 100,000,000 tons of ore, high in copper and precious metals, compared with the presently operated Creighton Mine. A five-compartment shaft is being sunk to the depth of 2300 ft. The Mond Nickel Co. is also actively developing the Froid Extension, having completed a shaft 2030 ft. deep, from which levels are being developed at 1700 and 3000 ft. The International will use the Froid Mine ore for nickel, copper and precious metals recovery, while the ore from the Creighton Mine will take a secondary place, being employed largely for making Monel-matte.

CORRESPONDENCE

THE CHEMICAL PROFESSION

SIR,—In regard to the lucky dog of a chemist who had the opportunity to work 12 hrs. a day, seven days a week for the munificent remuneration of 1s. 2d. an hour, and to the comments of "Chemist" on the incident in your issue of November 25, will you grant me the opportunity also to say something? "Chemist" knew of at least half-a-dozen concerns in the beet sugar industry that pay £20 a month to "chemists" (I need the quotation marks again), for 84 hrs. a week for their four months' campaign.

Whether the pay be in pounds or dollars or marks or francs, I believe a somewhat similar situation exists in all industrial countries: many chemists deplore their low salaries; they compare the time and expense of their preparation with the pay received and it hardly seems worth while.

Of course, it isn't easy to be philosophical over an 84-hr. week at £20 a month in these days for professional or any other kind of work. But is it really professional work in which such men are engaged? How much previous training does it require to make those routine tests? How much professional judgment does it demand? How much scientific thought? I venture to suggest that what they perform in their long, 12-hr. shifts is manual labour rather than professional service. When a chemist accepts such a post, his professional life goes into eclipse and he becomes a day labourer. And if the men so employed have not the wit to organise and get better pay, whose fault is it?

It is a dreadful thing to be out of work, but it is remarkable how few really good men do stay idle or receive so little for their services. The need of real chemists who can think for themselves is greater to-day than ever it was before, because one industry after another is developing chemical control and discovering that its chemical features must be studied and mastered in the interests of economical operation and production.

Let us admit that many of the men who are pegging away for long hours and short returns are men who have studied diligently and taken their professional degrees. We can hardly blame their teachers, because they have instructed the successful men as well as those who fail. And yet the latter have missed something in their equipment.

Chemistry is a profession, not a trade. Chemists cannot do *professional* work in gangs in which all do the same thing. They may work at co-ordinated research with others, which is something entirely different, because the incidence of scientific scholarship among them is from many angles. If we were to take a group of the unfortunates who cannot make a decent living and examine them, I think we should be likely to find most of them lacking in one or more of the following respects:—

He has not learned the relations of his science to the life of to-day. He does not observe the incidence of chemistry on every hand and he lacks the initiative to prepare himself to improve and economise and control the laundry, the bakery, the boiler-house, the engine-room, the foundry, the machine-shop—in short, to consider as an industrial chemist the wasteful activities which he meets on every hand.

He has not prepared himself for chemical industry by the study of unit processes and the immense variety of apparatus available to achieve the best results with different materials. He can neither specify nor design.

He may not have learned to express himself so as to tell an uninformed person of the incidence of chemistry upon his affairs.

I know of a great organisation that has many departments. Heads of these departments attain promotion when they have worked themselves out of their jobs; when their departments run so well that they are no more needed for supervision. How many of these unsuccessful chemists could or would work themselves out of jobs for promotion?

Some of them will be found to have studied and worked under the illusion that in professional life promotion goes by seniority. It does not.

Some have been careless in the selection of the biological strain contributed by their parents and earlier forebears, some should not have become chemists and some splendid fellows are pegging away under a streak of hard luck with the chances a hundred to one that they will pull out. In short, I suggest that we draw upon that very direct oriental jargon known as Pidgin English and recognize chemists as of two sorts: Can-do and no-can-do.

It seems improbable to me that the Society of Chemical Industry or any other scientific organisation can do anything effective on behalf of those who have studied professionally to do a man's work, but find themselves restricted in their activities to work which does not require more mind than that of a boy.

This is a nasty letter to write, Mr. Editor, but I think the time is fast approaching when the distinction will have to be made between can-do and no-can-do chemists.

I am, Sir, etc.,

ELLWOOD HENDRICK

139, East 40 Street,

New York, December 10

PERSONAL AND OTHER ITEMS

In consequence of the amalgamation of certain works of Sir W. G. Armstrong Whitworth & Co. and of Vickers, Ltd., the board of the former company has been reconstituted as follows:—Lord Southborough (chairman), Mr. J. Frater Taylor (vice-chairman), Sir Eustace Tennyson d'Eyncourt, Mr. J. Ferguson, Sir G. Hadcock, Mr. J. Hawson, Lieut.-Col. C. F. Hitchins, Mr. B. Irving, Mr. J. D. Siddeley, and Mr. J. Stewart. It is interesting to note that Mr. Ferguson is one of the partners of Sir Alexander Gibb and Partners, the well-known consulting engineers; Sir Alexander Gibb is, of course, the President of the Institution of Chemical Engineers.

Messrs. Briggs, Son & Co., West Yorkshire coalowners, have offered a scholarship of £150 a year for 5 years to the Mining Department of the University of Leeds.

The degree of D.Sc. in chemistry of the University of London has been conferred upon Mr. A. W. Chapman and Miss P. V. McKie.

The late Mr. J. Brierley, asbestos mill manager, for over 40 years with Turner Bros. Asbestos Co., Ltd., left £12,203.

New Beet-Sugar Factory

A contract, amounting to over £350,000, for the erection of a beet-sugar factory at Brigg, Lincolnshire, has been awarded to Stewart & Partners, Ltd. The factory, which is to be ready for the 1928 campaign, will be capable of dealing with 1000 tons of beet per 24 hrs., and will be able, in the campaign October to January, to treat the crop from 12,000 acres. The design of the factory is by the Hallesche Maschinenfabrik, but not less than 75% of the machinery will be made in this country.

Third Census of Production (Non-ferrous metals trades)

The following figures are from a statement which shows the output in the year 1924 of firms whose main business consisted in the smelting, rolling and casting of copper and brass, and is confined to the output in Great Britain:

Products, 1924	Quantity Tons	Selling Value £
Brass and alloys of copper		11,081,000
Copper		7,927,000
Aluminium		
Crude	2,200	266,000
Manufactures	200	40,000
Nickel alloys		
Manufactures (including tubes)	200	27,000
Tin:		
Blocks, ingots, bar, slabs and manufactures	200	50,000
White metal alloys (i.e., alloys of tin, lead, zinc, antimony, etc., other than soft solder)		
Unwrought or partly wrought		
Anti-friction metal	1,300	101,000
Other sorts	100	19,000
Other non-ferrous metals or alloys, not elsewhere specified, and manufactures thereof		229,000

Figures are also given below of the output in 1924 of firms mainly engaged in the smelting, casting or rolling of lead, tin, zinc, aluminium and other non-ferrous metals. Among other products were the following:—

Products, 1924	Quantity Tons	Selling Value £
Aluminium		3,058,000
Antimony and manufactures thereof	1,200	195,000
Arsenic, bismuth, cobalt and magnesium and manufactures thereof		198,000
Lead		5,835,000
Other manufactures (except white lead)		
Weight stated	21,500	929,000
Weight not stated		261,000
White lead	27,500	1,174,000
Nickel, unwrought and manufactures thereof	10,400	1,169,000
Nickel alloys		751,000
Tin:		10,860,000
Tungsten (except ferro-tungsten) in powder, wire and other forms	712,000*	105,000
Zinc		1,581,000
Crude (i.e., cakes, slabs, blocks, etc.)	16,600	211,000
Manufactures (including sheet zinc oxide, etc.)	4,900	1,360,000
Brass and alloys of copper (excluding nickel alloys and manufactures thereof)		130,000
Copper, unwrought and manufactures thereof (excluding copper sulphate)		6,000
Copper sulphate	21,000	165,000
Gold, melted and refined	10,700*	17,000
Platinum, refined	8,000*	206,000
Silver, refined and manufactures	1,980,000*	303,000
Palladium, iridium and other precious metals		183,000
Paints and enamels prepared (including ready mixed)		281,000
Total value of goods made and work done		31,222,000

* lbs. 14 oz. (112 lb.)

The total production of pig lead in the United Kingdom in 1907 was estimated as about 141,000 tons, of which 111,000 t. were produced for sale and 30,000 t. were used by the makers in their own works in the production of sheet, pipes, etc. The 1924 output of Great Britain

totalled 58,700 t. Exports of pig lead in 1907 were 27,000 t. or about 19% of the total production, as against 9400 t. in 1924, or 16% of the production. Net imports of pig and sheet lead increased from 191,000 t. in 1907 to 228,000 t. in 1924. White lead is produced on a large scale by paint and colour manufacturers, the total amount made during 1924 by such firms being returned as about 8100 t., whilst lead smelters returned an output of white lead amounting to 28,200 t. Exports during the year amounted to 8800 t. out of the total production of the United Kingdom of 50,000 t. Net imports of white lead were in 1924 6600 t., and in 1907 14,800 t. The tin production in 1907 was 13,100 t. of unwrought tin, valued at £2,195,000, compared with 38,400 t. valued at £9,477,000 in 1924. Exports of unwrought tin amounted in 1907 to 8700 t. and to 18,100 t. in 1924, and imports for the two years were 17,000 t. and 5900 t. respectively. The total weight of crude zinc or spelter returned in 1907 was 38,000 t. valued at £918,000, plus a further 10,000 t. valued at £298,000 returned on schedules for other trades. This compares with the 1924 output of 46,600 t. valued at £1,581,000. Exports in 1907 amounted to 5200 t., whilst net imports were 89,000 t. against exports of 6100 t. in 1924 and imports totalling 118,500 t. The net output of the factories and workshops covered by the foregoing statement was £5,943,000 in the year 1924, the net output per head of persons employed being £289 (£133 in 1907). The average number of persons employed in 1924 was 20,544 compared with 8233 in 1907. The total capacity of engines employed in the industry in 1924 was 65,953 h.p., of which slightly over 6% was in reserve or idle during the year. The capacity of electric motors at factories was not ascertained in 1907, but in 1924 motors aggregating 34,068 h.p., driven by purchased electricity, were recorded, of which slightly over 9% capacity was in reserve or idle during the year. The capacity of electric generators at these factories during 1924 was 39,020 kw., and 6297 kw. in 1907.

Third Census of Production (Aerated Waters, Cider, Vinegar, British Wine and Cognate Trades)

Below are given figures of the outputs during the years 1924 and 1907 of table waters and other goods produced by firms in Great Britain making returns on schedules for these trades:—

Products	1924		1907	
	Quantity Gallons	Selling Value £	Quantity Doz. bottles Gallons	Selling Value £
Table water	36,001,000	4,848,000	94,054,000	4,046,000
Cider and perry	8,653,000	967,000	2,603,000	151,000*
Wine, British made	1,742,000	390,000	817,000	108,000*
Vinegar and acetic acid	14,613,000	979,000	11,769,000	422,000*
Lime and lemon juice	531,000	151,000	1,794,000	203,000
Other fruit juices	96,000	41,000		
Non-alcoholic drinks, brewed (e.g., ginger beer, herb beer, etc.)		302,000		221,000*
Beer and ale purchased and bottled		2,114,000		164,000
Other liquors purchased and bottled		139,000		19,000
Other products		331,000		265,000
Total value		10,391,000		5,562,000

In order to avoid the possible disclosure of particulars relating to certain firms, the figures for Ireland (amounting to £37,000) were, in these cases, included with those for the rest of the United Kingdom in the year 1907. This sum is not included in the total for the year 1907.

Excluding the value of beer, ale and other liquors bottled and that of "other products," the total value of

goods produced in 1924 amounted to £7,477,000 and in 1907 to £5,114,000. The net output of aerated waters, cider, vinegar, British wine and cognate trades in 1924 was £5,751,000, and the net output per head of persons employed in that year was £316, in 1912 £131, and in 1907 £125. The average number of persons employed during 1924 at the factories and workshops was 18,217, compared with 26,540 in 1907, and 28,000 in 1912. The total capacity of engines employed in the industry in 1924 was shown as 6,720 h.p., of which about 13% was in reserve or idle during the year. The capacity returned in 1912 was 7,018 h.p., and in 1907, 10,410 h.p. The capacity of electric generators at these factories during 1924 was 210 kw., compared with 191 kw. in 1907, and 569 kw. in 1912.

Third Census of Production (Leather Trade)

The figures given below show the value of the leather outputs for the years 1907 and 1924, the particulars for the latter year being given in aggregate figures in respect of undressed and of dressed leather, in order to conform to the more restricted detail in which the output of the trade in 1907 was returned:—

Products	Selling Value, 1924 £	Selling Value, 1907 £
Leather, undressed	15,026,000	8,646,000
Leather, dressed, other than varnished, japanned or enamelled	11,905,000	5,957,000
Leather, varnished, japanned or enamelled	897,000	299,000
Machinery belting	1,192,000	1,159,000
Machinery accessories of leather	453,000	114,000
Flat leather	585,000	89,000
Wool	560,000	681,000
Hair	186,000	73,000
Hides and skins, pickled, etc.	362,000	230,000
Machinery accessories of hide	104,000	91,000
Parchment and vellum	51,000	41,000
Waste products	215,000	316,000
Other products	492,000	302,000
Work done for the trade	587,000*	204,000*
Total Value	32,948,000	18,202,000

* Amount received for work done

Calculated in terms of value, the 1924 output of undressed leather sold or added to stock as such exceeded the 1907 figure by about 74%, whilst for dressed leather the value shown for 1924 was a little more than double that of 1907. The average value per ton of undressed leather made in 1907 and returned by weight was about £120, and in 1924 £145, an increase of only 20%; for dressed leather other than varnished, japanned or enamelled, the average value per ton produced in 1907 was about £154, and in 1924 about £260, the increase being 68%. On this basis the aggregate values for the two years indicate that a fairly considerable increase in the production of both undressed and dressed leather occurred in the later year. On the other hand, the quantity of machinery belting made in 1924 (2600 tons) was only about one half of that recorded for the year 1907 (5300 tons). The net value of the output of factories and workshops engaged in the leather industry in 1924 was £8,711,000, and the net output per head of persons employed in 1924 was £286, and in 1907 £117. The average number of persons employed during 1924 at factories and workshops was 30,458, compared with 28,671 in 1907. The total capacity of engines at the leather factories in 1924 was shown as 40,747 h.p., of which nearly 14% was in reserve or idle during the year. In 1907 the capacity returned was

22,495 h.p. The capacity of electric motors at factories was, in 1924, 33,536 h.p., driven by purchased electricity, and slightly over 11% of the capacity of these motors was shown as in reserve or idle during the year. The capacity of electric generators at factories was, in 1924, 9315 kw., compared with 1568 kw. in 1907.

Metallurgy in British Columbia

The mineral production of British Columbia, which in 1925 exceeded all previous records by reaching a value of \$61,492,242, surpassed this amount in 1926 by several million dollars. It has been estimated by Mr. J. D. Galloway, Provincial Mineralogist, that the mineral production of British Columbia in 1926 reached \$67,718,000, an increase over 1925 of 11%. This increase is due more to acceleration by the larger companies than to the advent of new producers. The Consolidated Mining and Smelting Co., Ltd., increased the capacity of their Sullivan mill from 3000 to 4000 tons a day, and completed a new mill at Moyie to treat the old dumps of the St. Eugene mine. The Britannia Mining and Smelting Co. increased the capacity of their mill from 3000 to 3300 tons a day. The Granby Consolidated Mining, Smelting and Power Co., during the first nine months of the year, increased their monthly production of copper from 3,130,296 lb. to 3,394,013 lb., and lowered the costs from 9.240 to 7.896 cents per lb. The Allenby Copper Co., a subsidiary of the Granby, which operated for only a few months of 1925, has been producing throughout 1926 at the rate of 2000 tons of ore a day. Early in the year the capacity of the Premier mill was doubled to 400 tons a day. Almost all of the smaller producers have slightly increased their production for the year. The coal production will probably show a small decrease this year, due to fuel-oil competition and an unusually small demand for domestic purposes.

One of the most outstanding developments of the year was the success attained by the Allenby Copper Co. in operating the large low-grade copper deposits of Copper Mountain, near Princeton. These deposits contain several million tons of developed ore consisting of nearly equal proportions of bornite and chalcocopyrite, rather finely disseminated in a highly aluminous and somewhat refractory gangue. The mill is now treating 2000 tons of this ore daily and producing a concentrate carrying 30% copper, which is smelted by the Consolidated Mining and Smelting Co., Ltd., at Trail, B.C. The operations of the Allenby Copper Co. yielded a profit of \$86,633 during the second quarter, and a profit of \$116,335 during the third quarter of 1926. In view of the many failures to operate this property, the present success is a tribute to the management of the company.

Other developments in milling and metallurgy are worthy of mention. The Consolidated Mining and Smelting Co., Ltd., have enlarged the capacity of their lead smelter from 350 to 400 tons a day, and their zinc refinery from 200 to 280 tons a day. The same company expects soon to commence the erection of a refinery to treat the cadmium which is recovered as a by-product from the Sullivan ores. They will also, in the near future, double the daily capacity of their concentrator to 600 tons. A mill of 100 tons daily capacity will soon be completed at the Dunwell mine in the Stewart district.

International Conference on Bituminous Coal

Dr. Thomas Stockham Baker, president of the Carnegie Institute of Technology, Pittsburgh, Pennsylvania, U.S.A., expects to spend six weeks in Europe during February, March, and April of 1928, to organise plans for the Second International Conference on Bituminous Coal at Pittsburgh. The first conference, it will be remembered, was held in November, 1926, under the auspices of the Carnegie Institute of Technology, and was attended by 1700 delegates and leading fuel scientists from thirteen different countries. The second conference, which will be held under the same auspices, is fixed for the week of November 19, 1928. President Baker's itinerary will include visits to scientists throughout Europe. His European address, after February 25, will be the Guaranty Trust Company, Paris, France. In connexion with the preliminary plans a decision has been made to include the subject of "synthetic fertilisers from coal" in the program for the second conference. Other subjects to be considered will probably include the latest development in obtaining substitutes for gasoline from coal, power from coal, low and high-temperature distillation processes, smokeless fuel, gasification of coal, utilisation of coal tar products, and coal in relation to the production of fixed nitrogen. Formal letters of invitation to be officially represented at the 1928 meeting have been sent to the ambassadors, ministers, and *chargés des affaires* in Washington of the following countries:—Argentina, Belgium, Brazil, Chile, Cuba, France, Germany, Great Britain, Italy, Japan, Mexico, Peru, Spain, Austria, China, Czechoslovakia, Denmark, Greece, Hungary, Norway, Panama, Poland, Sweden, Switzerland, Netherland, and Roumania.

U.S. Export Trade in Chemicals

Exports of chemicals and allied products from the United States during the first three quarters of 1927 advanced 9% in value from \$132,428,000 in the first three quarters of 1926 to \$145,000,000 in the 1927 period. Improvements occurred in all of the major groups with the exception of fertilisers and explosives. Notable decreases in the prices of rosin and turpentine kept the aggregate value of the naval stores group at about the same figure as in 1926, but quantities were much higher. In the coal-tar products group, exports of benzol and other crudes were much larger than in 1926, and in the fertiliser category phosphate rock shipments showed a tendency toward recovery, with much better demand from the larger European markets, especially England and Germany.

Developments in the United States

The Grasselli Dyestuffs Corporation intends to enlarge its plant at Grasselli, N.J., at a cost of \$200,000.

The plant of the American Aniline Products Co., New York, is to be enlarged at a cost of \$200,000.

The German Oxygen Industry

The "Gesellschaft für Linde's Eismaschinen A.-G. and the I. G. Farbenindustrie A.-G. are introducing a method for supplying oxygen in the liquid form, which is said to offer advantages and economies.

Long-distance Transport of Gas in the Ruhr

A memorandum has been issued by the "Deutscher Verein von Gas- und Wasserfachmännern" on the

question of the supply of gas in the Ruhr from one central station. The conclusion reached is that this is not desirable, though grouping is advocated. (*Z. angew. Chem.*, November 24, 1927.)

German Light Alloys Industry

It is reported that the Metallbank u. Metallurgische Gesellschaft A.-G., the Vereinigte Aluminiumwerke A.-G., and the Berg-Heckmann Selve A.-G. have amalgamated under the title of the "Vereinigte Leichtmetallwerke A.-G." Although the capital is said to be only £60,000, the I. G. Farbenindustrie has an important financial interest in the new company, which will specialise in a new light alloy steel, patented by the Berg-Heckmann Selve A.-G.

German Glycerin Industry

The German output of glycerin is estimated at 6000 to 7000 tons a year, or only two thirds the pre-war production. The chief producer is the Vereinigte Chemische Werke A.-G., of Berlin. According to the U.S. Trade Commissioner in Berlin, the decreased production is due to a decline in the consumption of soap. Work is said to be in progress on a process—used during the war—for the production of glycerin.

Cellulose Varnish in France

The du Pont de Nemours Co., of New Jersey, and the Société Centrale de la Dynamite, have founded the Société Française Duco, with a capital of 20 million fr., for the manufacture of cellulose varnish. A factory, which will be the largest of its kind in France, will be erected in the neighbourhood of Paris.

French Artificial Silk Industry

The Kuhlmann, Agache Fils and Dollfus-Mieg concerns have formed a company with a capital of 50 million francs for the manufacture of artificial silk. A licence for use of the Borvis process has been obtained.

The Rhodasset, a subsidiary of the Usines du Rhône, has made an agreement with German interests for the establishment of a cellulose acetate factory at Fribourg. Negotiations with a similar aim are said to be proceeding with Courtaulds in England and the du Pont Co. in the United States.

Production of Butyric Acid from Sawdust

The "Société le Kétol," which manufactures butyric acid from sawdust by the Lefranc process, is building a new factory at Sauley-sur-Meurthe, in the Vosges, and intends to build a second at La Cluse (Ain). The mixture of ketones obtained by distilling calcium butyrate, although too costly for use as a fuel, has been used as an anti-knock agent, and is suitable for preparing nitro-cellulose varnishes.

Belgian Sugar Output

The British Commercial Secretary at Brussels has forwarded statistics published in the *Moniteur Belge*, which show the output of Belgian sugar factories during October to have been 72,954,295 kg. (23,654,856 raw, 19,299,439 white powdered). The production of refineries is given as 12,841,062 kg., total stocks at end of month as 50,725,815 kg., and the month's consumption as 15,447,148 kg. According to the *Echo de la Bourse*, the beet sugar crop this year is proving unremunerative. The average yield in weight appears likely to be a good deal in advance of the 1926 output, but the percentage sugar content seems very deficient.

Italian Chemical Exhibition

In connexion with the Italian celebrations of the fourth centenary of Emanuele Filiberto and the tenth anniversary of the victory, to be held in 1928, a large exhibition will be held in Turin which will include a chemical exhibition. The chemical section will comprise the whole of the chemical and allied industries, including chemical engineering, but will be national in scope, except for exhibits of plant, apparatus and instruments. Applications for admission should be sent before December 31, 1927, to the Chemical Section of the Executive Committee, 24, via Carlo Alberto, Turin, Italy.

Economic and Industrial Conditions of Rumania

According to the report of the Commercial Secretary to the British Legation at Bucarest, there was a noticeable improvement during 1926 in the economic conditions of Rumania. There was an increase of exports, which was almost entirely due to oil and cereals. The new Customs tariff came into force on April 24, 1927, the main object being to protect all growing Rumanian industries in proportion to their capacity to supply the needs of the population. It is hoped that, with the growth of home manufactures, encouraged by the new high tariffs, an opportunity will present itself for the setting up of British machinery. Imports into Rumania from Great Britain amounted to nearly 10% in value of the total imports for the years 1923, 1924 and 1925. It is probable that the percentage declined in 1926 owing to the coal stoppage, but an improvement was shown for the first quarter of 1927. Industry in Rumania has shown progress during the last year, especially in those industries for which the raw materials were to be found in the country. The prospect of greater tariff protection had given an impetus to certain classes of industry, including the textile and metallurgical industries. During 1926 the production of oil was a record one. The area exploited was about 2500 hectares, on which approximately 3340 wells were installed by the end of the year—1605 producing, 1073 in working, and 662 abandoned or suspended. It is estimated that the oil-bearing land in Rumania amounts to about 20,000 hectares, with probable reserves of 150,000 hectares. The production of crude oil in 1926 was 3,241,329 metric tons, over 900,000 tons more than for 1925, which, at 2,316,979 metric tons, was a record yield. The following figures show the quantities, in metric tons, of the various products refined, the figures in brackets being for 1925:—Benzine, 749,963 (497,545); refined petroleum, 511,077 (365,033); mineral oil, 291,963 (211,888); residues, 1,478,425 (1,036,723). The total exports amounted to 1,492,953 metric tons, compared with 784,545 metric tons in 1925, as follows:—Benzine, 424,967; refined petroleum, 527,069; motor spirit, 199,808; mineral oil, 42,396; residues, 298,713. The reorganisation of the marketing of oil products on foreign markets is seriously engaging attention in view of the continued increase of production, and the most up-to-date refining plant is being installed to enable the producers to compete with the higher-class products of other countries.

New Oxygen Factory in Budapest

It is reported that the Favorit A.-G. intends to erect an oxygen factory in Budapest, whilst the Hydroxygen A.-G. is to undertake the production of carbon dioxide.

REVIEWS

OLD CHEMISTRIES. By EDGAR F. SMITH. Pp. xi + 89. London: McGraw-Hill Publishing Co., Ltd., 1927. Price 12s. 6d.

Dr. Edgar F. Smith has done much to promote the study of the history of chemistry in the United States, and his own researches on the subject are appreciated highly on both sides of the Atlantic. The present book is infused with the author's enthusiasm, and cannot fail to impart some share of it to his readers. Sumptuously produced (though the reviewer confesses to a dislike of the cream paper upon which the illustrations are printed), it does not pretend to be anything more than the outcome of a chemical bibliophile's contemplation of the old text-books of chemistry on his shelves. Those treatises which influenced the progress of chemistry in early days in America have been the subject of Dr. Smith's selection, and on this central theme he has strung together biographical and bibliographical particulars, many of which will, we fancy, be new even to the most widely-read historian of chemistry. How many chemists, for instance, have ever heard of Jane Marcet (died 1858, aged 89), and her delightful "Conversations on Chemistry"? And who remembers how Richard Watson, after having been made Bishop of Llandaff, destroyed all his chemical manuscripts as a sacrifice "to other people's notions . . . of *Episcopal Decorum*"? Dr. Smith has rescued from oblivion these and innumerable other interesting personal details, and his book is one which any chemist will find an enthralling companion for leisure hours, whilst its solid value as historical research is by no means insignificant.

We have noticed one or two typographical and other errors, e.g., p. 8, *Goeffroy* for *Geoffroy*; p. 51, *Mecaenas* for *Maccenas*; and p. 32, where Chaptal's initials are given as M. I. A.—surely the "M" is merely a contraction of "Monsieur"? Chaptal's Christian names were Jean Antoine Claude. E. J. H.

HANDBUCH DER ANORGANISCHEN CHEMIE. Part IV. First Half. Die Elemente der sechsten Gruppe des Periodischen Systems. Edited by Dr. R. AEBIG, Fr. AUERBACH, and Dr. I. KOPPEL. Pp. xii + 966. Leipzig: S. Hirzel, 1927. Price, paper, 60 m.; bound, 64 m.

Chemists will welcome this further instalment of an important text-book. The fourth volume will evidently be a large one, as this first half of the first part contains over 950 pages of text. It deals with the elements of the sixth group of the periodic classification, and contains a review of the chemistry of the whole group, by the late Prof. Auerbach, followed by a very full account of the four elements—oxygen, sulphur, selenium, and tellurium.

The book is especially useful at the present time, as all existing accounts of selenium and tellurium are long out of date, and it will yet be some time before Dr. Mellor reaches Group VI. Here we have the chemistry of the four elements, brought closely up to date (apparently to about April, 1927) in a characteristically thorough and complete manner.

It is, of course, impossible in a short time to examine critically the whole of such a work, but a part of it, the section on selenium, has been subjected to the searching test of use in connexion with research during the last few months. It has been found that nothing is omitted, even of recent literature, which may be considered to pertain to the inorganic chemistry of selenium. A careful examination of the very large section (452 pages) on sulphur leads to the conclusion that here, too, nothing of any importance has been omitted.

The numbered references are assembled at the end of each section—a very convenient method—and the book is well printed on good paper, yet of a manageable thickness. As a reference book for a chemist interested in the elements with which it deals, it must be highly commended.

H. V. A. BRISCOE.

GMELIN'S HANDBUCH DER ANORGANISCHEN CHEMIE. System—Nr. 2. Wasserstoff. Edited by the DEUTSCHE CHEMISCHE GESELLSCHAFT. 8th edition. Revised by R. J. Meyer and F. Peters. Pp. xvi + 273. Berlin: Verlag Chemie G.m.b.H., 1927.

This section of the eighth edition of "Gmelin" incorporates the literature up to the end of 1926. It is altogether praiseworthy that so short a time should have elapsed before publication. The survey is, of course, exhaustive in character—no less than 38 closely-printed pages are devoted, for instance, solely to the spectrum of hydrogen—and is well presented, tabulation being frequently employed. Ten pages are devoted to atomic hydrogen, and seven to triatomic hydrogen. A few rather obscure facts, applied as a test, were readily found in their appropriate sections, where the corresponding references were correctly quoted. This section (series—number 2), with that on the inert gases (series—number 1) forms Volume I of the "Handbuch." A. A. E.

DIE WELT DER VERNACHLÄSSIGTEN DIMENSIONEN: EINE EINFÜHRUNG IN DIE KOLLOIDCHEMIE, MIT BESONDERER BERÜCKSICHTIGUNG IHRER ANWENDUNGEN. By W. OSTWALD. 9th and 10th revised and enlarged edition. Pp. xv + 325. Dresden and Leipzig: Theodor Steinkopff, 1927. Price 12 gm.

The title of this work still holds a spell, although its author in the preface to the new edition admits that one can no longer speak of colloid chemistry as the science of a neglected domain. Of all the books that have helped in drawing attention to the importance of colloid chemistry, and in laying firm foundations upon which to amass an accurate knowledge of its domain, this book ranks highest. Its very title compels notice, its arrangement, clarity, broadness of view and felicity of exposition place it among the really great introductions to any science. Those who know the book do not require to be told this; to those who are not yet acquainted with it, the issue of a new edition offers an opportunity which will bring pleasure and profit, all the more if the book is read in German and not in translation. The work has been largely re-written and expanded, especially in the discussion of the practical and technical applications of colloid chemistry, and the addition of many footnotes and references to literature not only enhance its value, but ensure that recent progress is not

overlooked. This edition equally with the first can be thoroughly recommended, not only to the student, but to the practitioner.

H. W. GREENWOOD

KOLLOIDCHEMISCHE TECHNOLOGIE. Ein Handbuch kolloidchemischer Betrachtungsweise in der chemischen Industrie und Technik. Edited by Dr. R. E. LAESEGAARD and others. Pp. viii + 1047. Dresden & Leipzig: Th. Steinkopff, 1927. Price, paper, 66 m.; bound, 70 m.

A preliminary notice of this work appeared in May last (CHEM. & IND., Vol. 16, No. 18, 406). The complete work has now been received, and the impression made by even a cursory perusal of its 1000 pages is one of amazement and admiration. A common criticism of many German compendia is that they are undertaken by one man, and that it is not possible for an individual to cover so wide a field adequately. The present volume labours under no such disability. Its sections, each complete in itself, are the work of specialists. Thirty well-known colloid chemists have contributed articles covering the whole field of colloid chemistry and its applications to technology. The value of the book does not lie in its completeness, but in the remarkably comprehensive view it gives of the field of colloid chemistry, and the silent emphasis it lays on the necessity for an accurate knowledge of the laws regulating colloidal phenomena, to all who control technologically in industry to-day. Such a survey is of incalculable value to the chemist who desires to keep abreast of modern developments in his own and cognate industries. As a source of inspiration and of illustration of the methods and application of colloidal theory to the solution of technical problems, this work can hardly be surpassed. Its breadth may be realised if a dozen or so of the industries dealt with are mentioned: rubber, colours, ink, soap, paper, textiles, ceramics, cement, glass, brewing, tanning, glue, photography. Each section is well illustrated and excellently documented. Particular mention may be permitted of the one English contribution, namely, a masterly survey of the relation of colloid chemistry to the making of butter and margarine, by Dr. William Clayton, of Liverpool.

An adequate review of such a work is impossible, but it is possible to recommend the work to all progressive chemists as one that will prove of value in matters pertaining to their own work, will widen their horizon by indicating the methods and results obtained in other fields, and will emphasise the fact that materials, however dissimilar in outward appearance, yet obey the same physical laws, and are amenable to the same methods of investigation.

H. W. GREENWOOD

ON THE BECKMANN REARRANGEMENT. By MITSURU KUHARA. Edited by SHIGERU KOMATSU. Pp. 83. Kyoto: Kyoto Imperial University, 1926.

Mitsuru Kuhara was born in 1855, and died in 1919. For over twenty years he was professor of chemistry of the College of Science and Engineering in the Kyoto Imperial University. He was one of the founders of the Chemical Society of Japan (1878), and was elected as its first president. His principal work was "On the Beckmann rearrangement," under which title nine papers were published between 1908 and 1920, out of a total of 32 original papers which he contributed to various

journals. In view of their outstanding character, his pupils have reprinted this series of papers in a separate volume, as a tribute to his memory. Since these papers were all published in Japan (although not in Japanese), and deal with a subject of very wide general interest, there will be many workers in the field of organic chemistry who will be glad to have them collected for easy reference within a single cover, in a volume comparable with a single issue of the journal in which they first appeared.

- **ALLEN'S COMMERCIAL ORGANIC ANALYSIS.** Fifth edition.
 - Vol. V. Tannins, Inks, Leather, Colouring Matters in Foods, Aniline, etc. Pp. xii + 700. London: J. & A. Churchill, 1927. Price 30s.

This book presents the reviewer with a somewhat difficult task, as it includes such a heterogeneous collection of monographs arranged in no logical order. The following are the sections contained in this volume in the order in which they are given: Tannins; Writing, stamping, typing, and marking inks; Printing inks; Amines and ammonium bases; Analysis of leather; Colouring matters of natural origin; Colouring substances in foods; Benzene and its homologues; Aniline and its allies; Naphthylamine, pyridine, quinoline, and acridine bases. Most of the sections appear to be full, accurate, and up-to-date, but the book as a whole suffers from lack of cross references between the sections in those cases where closely related substances are dealt with in different sections. For example, antipyrine and pyramidon are described in the sections on amines and ammonium bases, and one might naturally expect to find acetanilide and phenacetin in the same section, but these are to be found some 250 pages further on in the section devoted to aniline and its allies.

These and other deficiencies are difficult to avoid in a large work such as this, which has gradually evolved and developed into something quite different from and lacking the unity of its original state. The responsibility for each section now rests not only with the present authors and editors, but also with the previous contributors whose work has to be altered and enlarged to bring it up to date.

The individual sections of the work are mostly excellent, though some are far better and more authoritative than others. By far the largest section of the volume is that on tannins by Dr. M. Nierenstein, which is remarkably full and complete. The preliminary theoretical part, though of interest, is perhaps somewhat excessively full in a work dealing with analysis. The section on writing inks, etc., by Mr. C. Ainsworth Mitchell, is excellent, and, though short, is full of useful and accurate information. The section on printing inks by Mr. J. B. Tuttle is short and clearly written, but might be somewhat expanded with advantage, particularly with regard to British practice, the point of view of the writer being somewhat too exclusively American. Dr. H. E. Cox, who has revised the section on amines and ammonium bases, has had a somewhat more difficult task than most of the other contributors, as most of the compounds of importance in the field of commercial organic analysis which might have come under this category have been allotted to other sections. Most of

the information given appears to be accurate and complete, but the description of the colour reactions of pyramidon is not quite accurate, especially with reference to dilute solutions, such as are usually dealt with after the extraction of pyramidon from mixed drugs. The section devoted to the analysis of leather is written by Mr. A. E. Caunce, and amounts to less than twenty pages, which appears to be a somewhat meagre allowance, but within these limits the subject is dealt with clearly and thoroughly.

The section on colouring matters of natural origin, by Prof. W. M. Gardner, rightly devotes most attention to indigo, the analytical aspects of this important dyestuff being well described. Some of the other natural dyes are rather scappily treated: for example, under annatto nothing is said about its detection in milk or butter, nor of its colour reaction with stannous chloride. A little more might also be said about the detection of gamboge, as it is the only natural dyestuff the use of which in foodstuffs is prohibited in this country. One of the most interesting sections of this volume is that on the detection of dyestuffs in foods, revised by Mr. W. E. Mathewson. This difficult subject is dealt with in great detail, attention being given to spectroscopic examination in addition to the ordinary physical and chemical methods of detection. Lists are included of the permitted food colours of the U.S.A. and of France, but, unfortunately, none is given of the colours prohibited for this purpose in Britain. Similarly, the section on benzene and its homologues by Mr. J. Bennett Hill deals with American rather than British practice, and, unfortunately, the minor details of the standard processes differ appreciably in the two countries. No mention is made of the determination of aromatic hydrocarbons in petrol by the aniline point method, which is the one usually used in this country. The last two sections on aniline and its allies, and on naphthylamine, pyridine, quinoline, and acridine bases are by Mr. A. B. Davis. The first of these includes aniline and its derivatives and homologues, and also some of the derivatives of the aminophenols, including ortho-anisidine, and phenacetin and its derivatives. A quantity of useful and detailed information is given concerning these, but para-aminophenol and the various photographic developers derived from it are badly neglected. The last section on the naphthylamines and the heterocyclic bases is on similar lines, and includes the important flavine antiseptics derived from acridine.

In spite of the few minor blemishes to which attention has been drawn, the book is extremely valuable, and is one which no industrial organic chemist can afford to be without.

PERCY MAY

DIE REAKTIONSFÄHIGKEIT DES KOKSES. By Drs. R. MEZGER and F. PISTOR. Part 12. Kohle, Koks, Teer. Abhandlungen zur Praxis der Gewinnung, Veredelung u. Verwertung der Brennstoffe, edited by Dr. J. Gwosdz. Pp. viii + 88. Halle: Wilhelm Knapp, 1927. Price, paper, 7.20 r.m.; bound, 8.80 r.m.

This book is Vol. 12 of the series "Kohle, Koks, Teer," and constitutes a companion to Vol. 6, by Häusser

and Bestehorn, on the combustibility of coke (cf. *CHEM. AND IND.*, 1926, 325). The authors' methods of attack form an interesting contrast, for, whilst Häusser and Bestehorn experiment with a charge of several hundred kgs. of lump coke, the present authors determine the "reactivity" on only 0.2 g. of 200-250-mesh coke, claiming for their method rapidity, homogeneity of sample, and applicability to cokes produced both on the large scale and in a laboratory crucible. Details of the method and deductions from the results have appeared elsewhere (cf. *B.*, 1927, 160-161).

The widespread lack of uniformity in the use of the terms "reactivity" and "combustibility" as applied to coke is becoming increasingly confusing and regrettable. The present authors deal with the determination of the rate of burning of coke in air, and refer to it as "reactivity." Surely it were more rational to speak of "combustibility" in this connexion and apply the term "reactivity," when unqualified, to the other main blast-furnace reaction of coke, viz., its ability to reduce carbon dioxide.

The value of the book is greatly enhanced by an excellent bibliography and a detailed and critical account of the methods and results of previous investigators. It will be found a most useful work of reference to all concerned with elucidating the causes of the different combustibility of different cokes.

W. T. K. BRAUNHOLZ

LE CAOUTCHOUC DURCI. By A.-D. JETERINGER. *Encyclopédie du Caoutchouc et des Matières Plastiques*, edited by A.-D. Gillard. Pp. 198. Paris: A. D. Gillard, 1926. Price 31.50 fr.

While an overwhelmingly large proportion of the world's output of raw rubber is utilised in the production of what are described, by contrast, as soft rubber goods, the manufacture of hard rubber, or, as it is more generally called in this country, ebonite or vulcanite, still forms an important branch of the rubber industry.

The present work forms part of the "Encyclopédie du Caoutchouc et des Matières Plastiques," and a general knowledge of rubber technology is presupposed, such information as is to be found in the companion volumes being omitted. The author's previous writings will lead readers to expect a thoroughly scientific treatment, and this is manifested throughout the book. For example, in discussing the production of ebonite dust extensive reference is made to the recent publications of Gibbs and others relating to the risk of explosion.

At the same time due regard is paid to the practical aspect of ebonite manufacture, and in describing the making and finishing of sheets, tubes, rods, and moulded articles such incidentals as the preparation of sheet tin and the use of suitable mould varnishes receive attention.

Exception might be taken to the amount of space allotted to the reproduction of a number of mixing formulæ, many of which are of purely sentimental interest, recalling as they do the days when chemists had not yet begun, or were only just beginning, the series of investigations which ultimately pointed the way for the construction of rubber mixes on a scientific basis. Moreover, many of the grades of wild rubber specified would be unobtainable to-day, the development

of the plantation industry having resulted in their disappearance from the market.

One of the best chapters in the book is that which deals with the use of ebonite in making or covering chemical plants such as tanks, rollers, and hydro-extractors, and a consideration of some of the difficulties involved may help to explain why a material so resistant to alkalis and weak acids has not found wider application in chemical industry.

The book will be welcomed as the first to be devoted exclusively to ebonite, references to which in technical literature have hitherto been restricted to chapters in works dealing with the rubber industry as a whole. Its appearance at the present moment is opportune, the developments in the use of electricity and the advent of radio-telephony having served to draw attention to the value of ebonite as an insulating material.

B. D. W. LUFF

THE DISPOSAL OF SEWAGE. By T. H. P. VEAL, B.Sc., A.M.Inst.C.E. Pp. xiv + 173. London: Chapman and Hall, Ltd., 1927. Price 10s. 6d.

The author of this book is lecturer in civil engineering at the University of Birmingham, and he has set himself the task of explaining without unnecessary detail the main principles of sewage disposal in a manner suitable for students of the subject. This task has been very successfully accomplished within the limits of a small text-book containing 11 chapters.

After a brief historical introduction, the author discusses the factors which influence the quantity and quality of the sewage which has to be dealt with at the disposal works, but he does not perhaps sufficiently stress the fact that the design of the works should be based upon careful gaugings of the flow and analyses of the sewage. In the several illustrations of storm-water overflows the omission of a dip-plate or other device for preventing the discharge of objectionable floating matters direct to the stream should be noted, and the value of Fig. 2, showing the daily fluctuations of flow, would be enhanced by the inclusion of a horizontal dotted line indicating the average flow.

Five chapters are devoted to a discussion of the processes and works by which a satisfactory effluent can be produced. These include land treatment, screening, grit or detritus tanks, settlement (including septic) tanks, contact beds and percolating filters, and bio-aeration. The discussion is well compressed into 100 pages, and the chapter on bio-aeration tanks gives a very clear idea of the present position of the activated sludge process. Settlement tanks six times as long as they are wide would probably be generally regarded as too long.

The three final chapters of the book deal with sludge disposal, lay-out and cost of works, and sewage disposal in rural districts. The works of several towns are briefly described, and subsoil irrigation is recommended for country houses. This system is not generally considered as satisfactory as that recommended by the Ministry of Agriculture for small holdings.

Throughout the book frequent reference is made to the recommendations of the Royal Commission on Sewage Disposal, and to the requirements of the Ministry of

Health with regard to sewerage and sewage disposal works for which a local authority seeks sanction to borrow money to be repaid over a period of years.

The book is well balanced and can be safely recommended to the student of civil engineering and to all who wish to understand the principles of sewage disposal.

H. T. CALVERT

HISTORY OF EXPLOSIVES INDUSTRY IN AMERICA. By A. P. VAN GELDER and H. SCHLATTER. With an Introduction by Dr. C. E. MUNROE. Pp. xxxviii + 1132. Prepared from data collected by, and published under, the direction of the Institute of Makers of Explosives. New York: Columbia University Press; Humphrey Milford, Oxford University Press, 1927. Price 50s.

The time was certainly ripe, if not overdue, for the publication of a history of the development of the explosives industry in America. All those concerned can be congratulated on the volume under review, which is certainly worthy of the theme with which it deals.

The book is fittingly introduced by that doyen of explosives experts, Dr. Charles E. Munroe, who deservedly praises the thoroughness with which the two authors have accomplished their task.

There is one criticism which may be permitted. The technical side of the development of the explosives industry has received rather scant attention, the bulk of the volume being concerned with the commercial and industrial phases. The accounts of the rise, progress and decline or absorption of the many American explosives companies, while useful for historical reference, are apt to be somewhat dull, especially to the British reader.

One can hardly resist a comparison of this volume with the corresponding British history, "The Rise and Progress of the British Explosives Industry," which was published in 1909 under the auspices of the International Congress of Applied Chemistry. The latter takes the form of a series of more or less disconnected essays by experts on the most important sections of the industry, e.g., "Nitrocellulose," by MacDonald; "Permitted Explosives," by De Mosenenthal, etc., and the matter is dealt with mainly from the aspect of technical development. The American history, on the other hand, is a much fuller and more connected story mainly on the commercial side, and can certainly claim to be a better history. However, to a technical man, there is no doubt which is the more readable book.

For the general arrangement, printing, etc. of the book, there can be nothing but praise. It is profusely and well illustrated.

The last chapter dealing with "Explosives in the Making of America" deserves special mention. It shows in graphic manner the important part explosives have played in the development of modern civilisation, and is a record of achievement of which any industry might be proud.

Two slips which were noticed might be pointed out. The dedication is marred by a common mis-spelling, and on p. 19 the charge of black-powder for a ballistic pendulum is stated to be 35 hundred-weight.

J. WEIR

PARLIAMENTARY NEWS

Food Preservatives

Mr. Chamberlain informed Lieut.-Colonel Ruggles-Brise that preservatives were not allowed in dairy produce of any kind, whether imported or home produced, except in butter and cream, and the prohibition would apply to these articles also on January 1, 1928.—Dec. 8.

Oil Extraction (Bergius Process)

In reply to Colonel Day, the Duchess of Atholl said that the question of the results obtained at the Fuel Research Station, Greenwich was now under consideration, but it was probable that publication would be delayed until the investigations had been further advanced. No English process for the conversion of coal into oil by hydrogenation had been brought to the notice of the Fuel Research Board. As regards low-temperature carbonisation, besides the work undertaken at the Fuel Research Station, investigations had been conducted into, and reports had been published on, the following English processes: the "Parker" plant at Barugh, the Midland Coal Products, Ltd., plant at Netherfield, the "Fusion" rotary retort, the "Freeman" multiple retort of the British Oil and Fuel Conservation, Ltd., and the "Crozier" retort. The report on the last-mentioned was now in the Press.—Dec. 12.

Beet-sugar Subsidy

In a written reply to Sir D. Newton, Mr. Guinness stated that the price to the growers of beets delivered at established factories in each of the seasons 1928, 1929 and 1930 agreed between the National Farmers' Union and the Factories Committee will be 46s. per net ton of 15½% sugar content. Taking past results as a guide, the following calculation showed how the receipts of the sugar factories were related to the price which the beet grower received for the raw material. The average extraction of sugar for the last three seasons for factories in Great Britain was 13.3% and the average sugar content in beets was 17.01%. The white sugar content of 15½% would therefore be about 12.12%, or about 2.4 cwt. of sugar for each ton of beet delivered to the factory.

	s.	d.
The world price of 1 cwt. sugar at present is approximately	17	0
Add subsidy (at October, 1928 September, 1931, rates)	13	0
Add preference	4	3
	34	3
Amount obtained by factory on 1 cwt. of sugar after allowing for marketing charges	33	0
2.4 cwt. of sugar from 1 ton of beet at 33s.	79	2
4/5ths cwt. of molasses which with subsidy gives	6	0
1.1/7th cwt. of dried pulp	5	8
	90	10
The factory pays the grower for beet	46	0
Leaving the factory share of the receipts per ton of beet	44	10

The above statement does not enter into the relative costs of growing beet or of manufacturing sugar.—Dec. 13.

Sugar-beet Cultivation in Scotland

Sir J. Gilmour informed Mr. T. Henderson that in 1926 the area returned to the Board as under sugar beet was 3649 acres. The area as estimated by the companies in January, 1927, from which sugar beet was delivered to the factories was 3390 acres. The amount of subsidy paid was £74,058.13s., being £63,980 8s. 10d. in respect of sugar, and £10,078 4s. 2d. in respect of molasses. The area in 1927 as returned to the Board was 10,352 acres. The amount of subsidy paid for the crop of 1927 up to the present date was £32,316 1s. 9d. being in respect of sugar £32,088 1s. 7d. and in respect of molasses £228 0s. 2d. Dec. 13

Income Tax (Scientific Societies)

In a written reply to Mr. Clayton, Mr. Churchill stated that appeals to the High Court were pending against decisions of the Special Commissioners of Income Tax holding that two societies were not entitled to exemption from Income Tax on charities. These two societies, after discussion between representatives of a large group of learned and scientific societies and the Revenue authorities, had been taken as test cases. Unless these decisions of the Special Commissioners on appeal were reversed by the Courts, it would not be possible for the Inland Revenue to continue to make repayments of tax in respect of income of the general funds of other societies of the same character. Dec. 15.

Dead Sea Salts (Concession)

In reply to Colonel Howard Bury, Mr. Ormsby-Gore said there were discussions in 1926 between certain of the applicants with a view to combining interests, but the applications subsequently submitted were made on behalf of individual groups and not on behalf of any combine of groups. He also informed Lieut.-Commander Kenworthy that he understood that Major Tulloch and Mr. Novomeysky were supported by independent capital that was in no way connected with any of the existing chemical industries or potash owners or potash sellers. Dec. 19

Beet-Sugar Factories

Mr. Guinness informed Mr. Thurtle that fourteen beet-sugar factories were actually engaged in the manufacture of home-grown sugar during the 1926-27 season. Five other factories were planned with a view to working in the next season. Dec. 19

Oil Extraction (Bergius Process)

Lord Eustace Percy informed Mr. Hardie that the experimental Bergius plant at the Fuel Research Station has a throughput of about one ton of coal per day. The reaction chambers of the plant are made from medium mild steel. Dec. 20.

Olive Oil (Adulteration)

In a written reply to Sir B. Peto, Sir K. Wood stated that his attention had been drawn to the fact that, in order to utilise the stocks of ground nuts in Spain that had accumulated during this year, the mixing of oil from these nuts with olive oil had been authorised. He had no power to prohibit the importation of mixed oil. It would be illegal under the Sale of Food and Drugs Act to sell the mixed oil as olive oil, but there was nothing in those Acts to prevent its sale under some accurate description. Dec. 21.

COMPANY NEWS**BRITISH DRUG HOUSES, LTD.**

The usual quarterly dividend of 1½% has been announced on the preference shares.

SULPHIDE CORPORATION, LTD.

At the thirty-first annual ordinary general meeting, held on December 22, the chairman, the Rt. Hon. the Earl of Kintore, congratulated shareholders on a considerably improved profit and on prospects which seemed to point to the maintenance or increase of that profit in the present year. Increased output at Broken Hill and Cockle Creek had been realised; the reduction, however, in average metal prices, and especially in lead, had been so progressive and acute as to much more than neutralise the benefit of the favourable features in the year's work. As a result, the net profit was less than last year by £115,550. Instead of paying, as last year, 10% on both classes of shares, the company was now able to recommend only the payment of 7½% on the preference shares. During the year there was a large increase, due to reopening work, in the quantity of crude ore raised from the Central mine, Broken Hill. It was almost certain that there would be a further large increase of tonnage from the Central mine in the current year, the average so far having been about 2400 tons per week, equivalent to 120,000 tons for the year. Milling work at Broken Hill also showed a substantial increase, the tonnage of lead concentrates produced having been 25,289 t. (20,948 t.), and of zinc concentrates, 29,948 t. (23,552 t.). There had been increased production in all departments at Cockle Creek, the chief products manufactured there being sulphuric acid, superphosphates and cement. The third contact acid plant was completed and put into commission in May last. The demand for this class of acid still exceeded the supply, and the company was constructing a fourth contact plant. During the year 20,770 t. of mono-acid were produced (18,333 t.), and production of superphosphates rose from 31,294 t. to 33,879 t. Costs, however, were higher in the past year by about 3s. 6d. a ton high-grade, owing to an increase in the cost of phosphate rock and acid. The largest increase was in the cement department, the production of cement having risen from 24,328 t. to 42,884 t., whilst there had been a further increase in the current year. The English works at Seaton Carew suffered from the coal strike, with the result that production of spelter was only 3675 tons, as compared with 4955 t., and of sulphuric acid 7566 t. (9758 t.). Since work was resumed in December last, it had been continuously maintained on a considerably increased scale, so that the whole year's production should be considerably larger than anything previously achieved. The chairman stated that in a recent metal review it was estimated that the world's production of lead in 1927 would be approximately only 3·4% higher than it was in 1926, and yet the price of lead had fallen nearly 50%, whilst the profits of lead producers had fallen to an even greater extent. The cure for this appeared to lie in a cartel system, under which production should be so regulated as to avoid an excess of production unless there was a corresponding increase in demand for consumption. Meanwhile, reduction of output was being

brought about by the drastic effect of prices so low as to make production unprofitable for the less favourably situated mines, which no doubt was having considerable effect. In this connexion, the chairman of the North Broken Hill Co., speaking recently in Australia, said that although the immediate outlook was gloomy, he considered that an optimistic long view was justified, because he believed that a large proportion of the world's normal requirement of lead could not be profitably produced at the present low price of the metal.

SOUTH METROPOLITAN GAS CO., LTD.

A Bill to extend the limits of supply by the South Metropolitan Gas Company and to increase its capital has been deposited for next Session in the Private Bill Office of the House of Commons. The Bill proposes to extend the existing limits of supply so as to include a small area in Wandsworth and Mitcham, mainly bounded by the Southern Railway and the boundary between the counties of London and Surrey. Power is also sought to raise £1,000,000 additional capital by the issue of further ordinary or preference stock and to borrow on this capital a further sum of £500,000. Further borrowing powers are also sought to be exercised in respect of the issued capital to the extent of one half of the authorised capital of £7,997,395 actually raised. The company also proposes to amend its Act of 1920 with regard to the limitation of dividends so as to enable the company to issue ordinary stock of the same denomination as the existing ordinary stock, and to make all future issues of preference stock at such a rate of interest as the directors may determine at the date of the issue thereof.

LEEDS FIRECLAY CO., LTD.

The thirty-eighth annual meeting was held on December 20, Mr. C. F. Spencer, chairman, presiding. Notwithstanding the heavy loss of £11,263 for the five months to November 30, 1926, during the remaining seven months the loss was converted into a profit of £12,887, so that in effect the result for last year was better, from an operative standpoint, than the previous year. The directors had sufficient confidence in the position of affairs to recommend increased dividends on both preference and ordinary shares. After payment of dividends, and adding a further sum to reserve, £157,364 remained to be carried forward. As indicated at an extraordinary general meeting on November 25, an agreement was entered into on December 1 by the Farnley Iron Company (Fireclay Works), Ltd.—which is controlled by the Leeds Fireclay Co., Ltd.—to acquire the clay works and interests of the Farnley Iron Co., Ltd. The directors were unanimously of opinion that the arrangement would prove of great value to the company. Not only would an area of 750 acres be added to its mineral resources, but economies resulting from co-ordination of management and certain reductions in expenditure already arranged for should show an immediate saving of several thousands of pounds per annum. To raise the necessary funds in connexion with this arrangement, the company proposes to issue 100,000 preference shares at a premium. The company had also acquired the exclusive British rights of the Plasmann process for the low temperature carbonisation of coal. Early in 1926

the attention of the company was directed to the successful results attained by the Chemisch-Technische Gesellschaft, of Duisburg, and after careful investigation of the process and patents, the company concluded an arrangement to take over the British rights for this process. The salient features of the process were the continuous and automatic process which, without briquetting, would produce a smokeless fuel in large firm lumps from coal slacks or fines; the tar or crude oil produced was of remarkable purity, and was free from coal dust in suspension; and as the process was automatic, labour operating costs were considerably reduced. The chairman had inspected the first large plant in operation in Germany, a retort treating 50 tons of coal per day, being the first instalment of a plant to deal with 400 tons a day, and was very favourably impressed. The company had now on order a small plant to deal with 2½ tons of coal per day, which it was installing in order to test the suitability of the many different grades of British coals for treatment by this process and it was hoped that this oven would be delivered in January.

NOVOCRETE AND CEMENT PRODUCTS CO.

A net loss of £13,143 is shown for the year ended June 30, and, as a result, the debit balance on profit and loss account now stands at £35,775. The report states that in October 1926, the Factory at Park Royal was completed, and manufacture started. Although sales have increased, it has taken longer than expected to work sales up to a level on which receipts would balance outgoings. The directors are asking shareholders for authority to issue debentures up to £20,000 as and when required.

MARGARINE UNION, LTD.

This company has been formed with an authorised capital of £3,100,000, divided into £1,500,000 7% cumulative preferred shares of £1, of which £1,000,000 has been issued; £1,500,000 ordinary shares of £1, of which £1,000,000 has been issued; £100,000 6% deferred shares of 1s., all issued. The company will acquire control of the organisation of Van den Berghs, Ltd., and N.V. Margarine Unie has been formed in Holland to acquire control of the organisations of Anton Jurgens United (Margarine) Works, and Van den Bergh's Fabricken. These concerns are the three largest manufacturers of margarine in the world, owning, or controlling through their subsidiaries, factories and distributing organisations in Great Britain, Holland, France, Belgium, Germany, Norway, Sweden, Denmark, Italy, and the Dutch Indies. The aggregate issued capitals of Margarine Union, Ltd., and N.V. Margarine Unie will amount to £6,391,666, and their assets will include the entire holdings of ordinary shares of the Jurgens and Van den Bergh families in the three above-named concerns. The directors of Margarine Union, Ltd., are the Rt. Hon. the Earl of Bessborough, C.M.G. (chairman), His Excellency Dr. R. J. H. Patijn (vice-chairman), Messrs. A., H., R., and E. Jurgens, Messrs. S., A., L., and D. van den Bergh, Mr. J. H. Tresfon, and Mr. P. Rykens. The registered office is at Finsbury Court, E.C.2. It is reported that the Margarine Union has acquired a substantial interest in a Continental margarine concern owning seed crushing, oil refining and margarine factories.

MARKET REPORT

This Market Report is compiled from special information received from the Manufacturers concerned. Unless otherwise stated the prices quoted below cover fair quantities net and naked at sellers' works.

GENERAL HEAVY CHEMICALS

Acid Acetic, 40% tech.—£19 per ton.
 Acid Boric, Commercial.—Cryst., £30 per ton; Powder, £32 per ton; Extra fine Powder, £34 per ton.
 Acid Hydrochloric.—3s. 9d.—6s. per carboy d/d., according to purity, strength and locality.
 Acid Nitric 80° Tw.—£21 10s.—£27 per ton makers' works, according to district and quality.
 Acid Sulphuric.—Average National prices f.o.r. makers' works, with slight variations up and down owing to local considerations: 140° Tw., Crude Acid, 60s. per ton. 168° Tw., Arsenical, £5 10s. per ton. 168° Tw., Non-arsenical, £6 15s. per ton.
 Ammonia Alkali.—£6 15s. per ton f.o.r. Special terms for contracts.
 Bisulphite of Lime.—£7 10s. per ton f.o.r. London, packages extra.
 Bleaching Powder.—Spot, £9 10s. per ton d/d.; Contract, £8 10s. per ton d/d., 4-ton lots.
 Borax, Commercial.—Crystals, £19 10s.—£20 per ton; Granulated, £19 per ton; Powder, £21 per ton. (Packed in 2-cwt. bags, carriage paid any station in Great Britain.)
 Calcium Chloride, Solid.—£5—£5 5s. per ton, carr. paid.
 Copper Sulphate.—£25—£25 10s. per ton.
 Methylated Spirit, 61 O.P.—Industrial, 2s. 2d.—2s. 7d. per gal.; Pyridinised Industrial, 2s. 4d.—2s. 9d. per gal.; Mineralised, 3s. 3d.—3s. 7d. per gal.; 64 O.P. 1d. extra in all cases. Prices according to quantity as from Jan. 1, 1928.
 Nickel Sulphate.—£38 per ton d/d.
 Nickel Ammon. Sulphate.—£38 per ton d/d.
 Potash, Caustic.—£30—£33 per ton. Potass. Bichromate.—4½d. per lb. Potass. Chlorate.—3½d. per lb. ex whf. Lond. in cwt. kegs.
 Salammoniac.—£45—£50 per ton. Chloride of Ammonia.—£37—£45 per ton, carr. paid.
 Salt Cake.—£3 15s.—£4 per ton d/d. bulk.
 Soda, Caustic, solid.—Spot lots; delivered in 4-ton lots. £15 2s. 6d.—£18 per ton, according to strength. 20s. less for contracts.
 Soda Crystals.—£5—£5 5s. per ton ex railway depots or ports.
 Sod. Acetate 97/98%.—£21 per ton. Sod. Bicarbonate (refined).—£10 10s. per ton, carr. paid. Sod. Bichromate.—3½d. per lb. Sod. Bisulphite Powder 60/62%.—£17 10s. per ton delivered, home market, 1-cwt. iron drums included, £15 10s. f.o.r. London. Sod. Chlorate, 2½d. per lb.
 Sod. Phosphate.—£14 per ton, f.o.b. London, casks free.
 Sod. Sulphate (Glauber's Salt)—£3 12s. 6d. per ton.
 Sod. Sulphide conc. solid 60/65.—Spot £13 5s. per ton, contracts £13 carr. paid. Sod. Sulphide cryst.—Spot £8 12s. 6d. per ton, contracts £8 10s. carr. paid. Sod. Sulphite, Pea Cryst.—£14 per ton, f.o.b. London, 1-cwt. kegs included.

RUBBER CHEMICALS

Antimony Sulphide.—Golden.—6½d.—1s. 5½d. per lb. according to quality. Crimson.—1s. 4d.—1s. 6d. per lb., according to quality.
 Arsenic Sulphide, Yellow.—1s. 9d. per lb.
 Barytes.—£3 10s.—£6 15s. per ton, according to quality.
 Cadmium Sulphide.—2s. 6d.—2s. 9d. per lb.
 Carbon Bisulphide.—£20—£25 per ton, according to quantity.
 Carbon Black.—5½d. per lb., ex wharf.
 Carbon Tetrachloride.—£45—£50 per ton, according to quantity, drums extra.
 Chromium Oxide, Green.—1s. 1d. per lb.

Diphenylguanidine.—3s. 9d. per lb.
 Indiarubber Substitutes, White and Dark.—5½d.—6½d. per lb.
 Lamp Black.—£35 per ton, barrels free.
 Lead Hyposulphite.—9d. per lb.
 Lithopone, 30%.—£22 10s. per ton.
 Mineral Rubber "Rubpron."—£13 12s. 6d. per ton, f.o.r. London.
 Sulphur.—£9—£11 per ton, according to quantity. Sulphur Precip. B.P.—£47 10s.—£50 per ton, according to quantity.
 Sulphur Chloride.—4d.—7d. per lb., carboys extra.
 Thiocarbamide.—2s. 6d.—2s. 9d. per lb., carriage paid.
 Thiocarbamilide.—2s. 1d.—2s. 3d. per lb., according to quantity.
 Vermilion, pale or deep.—6s.—6s. 3d. per lb.
 Zinc Sulphide.—1s. per lb.

WOOD DISTILLATION PRODUCTS

Acetate of Lime.—Brown, £10 5s. per ton. Good demand. Grey, £14 10s.—£15 per ton. Liquor, 9d. per gal.
 Charcoal.—£6—£9 per ton, according to grade and locality. Foreign competition severe.
 Iron Liquor.—1s. 3d. per gal. 32° Tw.; 1s. per gal. 24° Tw.
 Red Liquor.—9d.—10d.
 Wood Creosote.—1s. 9d. per gal., unrefined.
 Wood Naphtha.—Miscible, 3s. 11d.—4s. 3d. per gal. Solvent, 4s. 3d. per gal.
 Wood Tar.—£4—£5 per ton.
 Brown Sugar of Lead.—£40 15s. per ton.

TAR PRODUCTS

Acid Carbollic.—Crystals, —7½d.—7½d. per lb. Crude 60's, 2s. 5d. per gal. prompt; lower for 1928 delivery.
 Acid Cresylic, 99/100.—2s. 11d.—3s. per gal. 97/99.—2s. 4d.—2s. 5½d. per gal. Pale, 95%, 2s. 3d.—2s. 4d. per gal. Dark, 95%, 2s. 1d.—2s. 2d. per gal.
 Anthracene Paste.—A quality, 2½d. per unit, 40%—£5 per ton; Anthracene Oil.—Strained, 8d.—8½d. per gal. Unstrained, 7½d.—8d. per gal.
 Benzole.—Crude 65's, 9½d.—9½d. per gal., ex works in tank wagons; Standard motor, 1s. 1½d.—1s. 2½d. per gal., ex works in tank wagons; Pure, 1s. 5d.—1s. 7d. per gal., ex works in tank wagons.
 Toluole. 90%, 1s. 4d.—1s. 8d. per gal. Pure, 1s. 10d.—2s. per gal.
 Xylol.—1s. 3d.—1s. 10d. per gal. Pure, 1s. 9d. per gal.
 Creosote.—Cresylic 20/24%, 10d.—11d. per gal. Middle Oil, 8d.—9d. per gal. Heavy, 8½d.—9d. per gal. Standard specification, 7½d.—7½d. per gal. ex works. Salty, 7d. per gal., less 1½%.
 Naphtha.—Crude, 9d.—10d. per gal. Solvent 90/160, 9½d.—10½d. per gal. Solvent 95/160, 1s. 3d.—1s. 4d. per gal. Solvent 90/190, 9½d.—1s. 3d. per gal.
 Naphthalene Crude.—Drained Creosote Salts, £5 per ton. Whizzed or hot pressed, £8 per ton.
 Naphthalene.—Crystals, £13—£13 10s. per ton. Flaked, £14—£15 per ton.
 Pitch, medium soft.—85s.—90s. per ton, f.o.b. according to district. Market firm.
 Pyridine.—90/140.—6s.—6s. 6d. per gal. 90/180—3s. 6d.—5s. per gal. Heavy.—3s.—3s. 6d. per gal.

INTERMEDIATES AND DYES

In the following list of Intermediates delivered prices include packages except where otherwise stated.
 Acid Gamma.—4s. 6d. per lb.
 Acid Amidonaphthol disulpho (1.8.2.4.)—10s. 9d. per lb.
 Acid A.—3s. per lb.
 Acid Naphthionic.—1s. 6d. per lb.
 Acid Neville and Winther.—4s. 9d. per lb.
 Acid Sulphanilic.—8½d. per lb.
 Aniline Oil.—8d. per lb., naked at works.
 Aniline Salts.—8d. per lb., naked at works.
 Anthranilic Acid.—6s. per lb., 100%.

Benzaldehyde.—2s. 3d. per lb.
 Benzdine Base.—3s. 3d. per lb. 100% basis d/d.
 Benzoic Acid.—1s. 8½d. per lb.
 o-Cresol 29/31° C.—5½d. per lb.
 m-Cresol 98/100%.—2s. 3d.—2s. 5d. per lb.
 p-Cresol 32/34° C.—2s. 3d.—2s. 5d. per lb.
 Dichloraniline.—1s. 10d. per lb.
 Dimethylaniline.—1s. 11d. per lb.
 Dinitrobenzene.—8½d. per lb., naked at works. £75 per ton.
 Dinitrochlorbenzene.—£84 per ton d/d.
 Dinitrotoluene.—48/50° C.—8d. per lb., naked at works.
 Dimnitrotoluene.—66/68° C.—9d. per lb., naked at works.
 Diphenylamine.—2s. 10d. per lb. d/d.
 α-Naphthol.—10d. per lb. d/d.
 β-Naphthol.—10d. per lb. d/d.
 α-Naphthylamine.—1s. 3d. per lb.
 β-Naphthylamine.—3s. per lb.
 o-Nitraniline.—5s. 9d. per lb.
 m-Nitraniline.—3s. per lb. d/d.
 p-Nitraniline.—1s. 8d. per lb.
 Nitrobenzene.—6d. per lb., naked at works.
 Nitronaphthalene.—1s. 3d. per lb.
 R. Salt.—2s. 2d. per lb.
 Sodium Naphthionate.—1s. 8½d. per lb. 100% basis d/d.
 o-Toluidine.—8½d. per lb.
 p-Toluidine.—2s. per lb., ex works, naked.
 m-Xylidine Acetate.—2s. 6d. per lb. 100%.
 N.W. Acid.—4s. 9d. per lb. 100%.

PHARMACEUTICAL AND PHOTOGRAPHIC CHEMICALS

Acid, Acetic, Pure, 80%.—£39 per ton, ex wharf London, in glass containers.
 Acid, Acetyl Salicylic.—2s. 3½d.—2s. 5d. per lb.
 Acid, Benzoic B.P.—2s.—2s. 3d. per lb. for synthetic product, according to quantity. Solely ex Gum—1s. 1s. 3d. per oz., according to quantity.
 Acid, Boric B.P.—Cryst. 36s. 39s. per cwt. Powder 40s.—43s. per cwt.; Extra Fine Powder, 42s. per cwt., according to quantity. Carriage paid any station in Great Britain in ton lots.
 Acid, Camphoric.—19s.—21s. per lb.
 Acid, Citric.—1s. 6½d.—1s. 7d. per lb. Less 5%.
 Acid, Gallic.—2s. 8d. per lb. for pure crystal in cwt. lots.
 Acid, Pyrogallie, Cryst.—7s. 3d. per lb. Resublimed. 8s. 3d. per lb.
 Acid, Salicylic.—B.P. pulv. 1s. 2½d. 1s. 3½d. per lb. Technical 11½d.—11½d. per lb.
 Acid, Tannic, B.P.—2s. 8d.—2s. 10d. per lb.
 Acid, Tartaric.—1s. 3½d. per lb. Less 5%.
 Acetanilide.—1s. 6d.—1s. 9d. per lb. for quantity.
 Amidol.—7s. 6d.—9s. per lb. d/d.
 Amidopyrin.—8s.—8s. 3d. per lb.
 Ammon. Benzoate.—3s. 3d.—3s. 5d. per lb., according to quantity.
 Ammon. Carbonate B.P.—Lump £37 per ton. Powder £39 per ton, in 5-cwt. casks. Resublimed.—1s. per lb.
 Atropine Sulphate.—9s. per oz.
 Barbitone.—5s. 9d.—6s. per lb.
 Benzonaphthol.—3s. 3d. per lb.
 Bismuth Carbonate.—10s. 4d.—10s. 7d. per lb. Bismuth Citrate.—9s. 10d.—10s. 1d. per lb. Bismuth Salicylate.—9s. 10s.—10s. 1d. per lb. Bismuth Subnitrate.—8s. 4d.—8s. 7d. per lb. Bismuth Nitrate.—6s. 1d.—6s. 4d. per lb. Bismuth Oxide.—13s. 10d.—14s. 1d. per lb. Bismuth Subchloride.—13s. 10d.—14s. 1d. per lb. Bismuth Subgallate.—8s. 1d.—8s. 4d. per lb. Extra and reduced prices for smaller and larger quantities respectively; Liquor Bismuthi et Ammon. Cit. B.P. in W. Qts.—1s. 1d. per lb.; 12 W. Qts.—1s. per lb.; 36 W. Qts.—11½d. per lb.
 Borax B.P.—Crystal 25s. per cwt. Powder 26s. per cwt., according to quantity, carr. paid any station in Great Britain in ton lots.

Bromides.—Ammonium.—1s. 11d.—2s. 1d. per lb.
 Potassium.—1s. 7½d.—1s. 9½d. per lb. Sodium.—1s. 10d.—2s. per lb. Granulated ½d. per lb. less.
 All spot. Large quantities at lower rates.
 Calcium Lactate B.P.—1s. 2½d.—1s. 3½d. per lb.
 Camphor, refined flowers, 2s. 11d.—3s. 1d. per lb., according to quantity; also special contract prices.
 Chloral Hydrate.—3s. 2d.—3s. 4d. per lb.
 Chloroform.—2s. 3d.—2s. 7½d. per lb., according to quantity.
 Cresote Carbonate.—6s. per lb.
 Ethers: S.G. 730, 10½d.—1s. 1½d. drums. Other gravities at proportionate prices.
 Formaldehyde.—£39 per ton. Ex wharf in barrels.
 Guaiacol Carbonate.—4s. 9d.—5s. per lb.
 Hexamine.—2s. 3d.—2s. 6d. per lb.
 Homatropine Hydrobromide.—30s. per oz.
 Hydrastine Hydrochlor.—English make offered, 120s. per oz.
 Hydrogen Peroxide (12 vols.).—1s. 4d. per gal. f.o.r. makers' works, naked. B.P.—10 vols., 2s.—2s. 3d. per gal.; 20 vols., 3s.—4s. per gal.
 Hydroquinone.—3s. 10d. per lb.
 Hypophosphites.—Calcium 3s. 6d. per lb. for 28-lb. lots. Potassium 4s. 1d. per lb. Sodium 4s. per lb.
 Iron Ammon. Citrate—B.P.—2s. 1d.—2s. 4d. per lb. Green, 2s. 4d.—2s. 9d. per lb. U.S.P. 2s. 2d.—2s. 5d. per lb.
 Iron Perchloride.—18s.—20s. per cwt., according to quantity.
 Magnesium Carbonate.—Light Commercial £31 per ton net.
 Magnesium Oxide.—Light Commercial £62 10s. per ton, less 2½%; Heavy Commercial £21 per ton, less 2½%; in quantity lower; Heavy Pure 2s.—2s. 3d. per lb.
 Menthol.—A.B.R. recryst., B.P., 15s. 6d. January delivery per lb. net. Synthetic detached crystals, 9s.—12s. 6d. per lb., according to quantity; Liquid (95%), 11s. 3d. per lb.
 Mercurials, B.P.—Up to 1 cwt. lots—Red oxide, 7s. 6d.—7s. 7d. per lb., Levig, 7s.—7s. 1d. per lb.; Corrosive sublimate, Lump, 5s. 9d.—5s. 10d. per lb., Powder, 5s. 2d.—5s. 3d. per lb.; White precip., Lump, 5s. 11d.—6s. per lb., Powder, 6s.—6s. 1d. per lb., extra fine, 6s. 1d.—6s. 2d. per lb.; Calomel, 6s. 4d.—6s. 5d. per lb.; Yellow Oxide, 6s. 10d.—6s. 11d. per lb.; Persulph B.P.C., 6s. 1d.—6s. 2d. per lb.; Sulph. nig., 5s. 10d.—5s. 11d. per lb. Special prices for larger quantities.
 Methyl Salicylate.—1s. 5d.—1s. 7d. per lb.
 Methyl Sulphonat.—9s.—9s. 3d. per lb.
 Metol.—9s.—11s. 6d. per lb. British make.
 Paraformaldehyde.—1s. 9d. per lb. 100% pdr.
 Paraldehyde.—1s. 1d.—1s. 4d. per lb.
 Phenacetin.—2s. 6d.—2s. 9d. per lb.
 Phenazone.—4s.—4s. 3d. per lb.
 Phenolphthalein.—6s. 6d.—6s. 9d. per lb.
 Potass. Bitartrate.—99/100% (Cream of Tartar) 96s. per cwt., less 2½%.
 Potass. Citrate.—B.P.C. 1911, 1s. 8d.—1s. 11d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb.
 Potass. Ferricyanide.—1s. 9d. per lb. in cwt. lots.
 Potass. Iodide.—16s. 8d.—17s. 2d. per lb., according to quantity.
 Potass. Metabisulphite.—6d. per lb., 1-cwt. kegs included. F.o.r. London.
 Potass. Permanganate.—5½d. per lb. spot.
 Quinine Sulphate.—1s. 8d.—1s. 9d. per oz. bulk in 100 oz. tins.
 Resorcin.—2s. 10d.—3s. per lb. spot.
 Saccharin.—55s. per lb., and lower in quantity.
 Salol.—2s. 4d. per lb.
 Sod. Benzoate, B.P.—1s. 8d.—1s. 11d. per lb.
 Sod. Citrate, B.P.C., 1911—1s. 8d.—1s. 11d. per lb.; B.P.C., 1923.—2s.—2s. 1d. per lb.; U.S.P., 1s. 11d.—2s. 2d. per lb., according to quantity.
 Sod. Ferrocyanide.—4d. per lb., carr. paid.
 Sod. Hyposulphite.—Photographic £15 5s. per ton, d/d consignee's station in 1-cwt. kegs.

Sod. Nitroprusside.—16s. per lb.
 Sod. Potass. Tartrate (Rochelle Salt).—90s.—95s. per cwt. net.
 Crystals, 5s. per cwt. extra.
 Sod. Salicylate.—Powder, 1s. 7d.—1s. 9d. per lb. Crystal,
 1s. 8d.—1s. 10d. per lb. Flake, 1s. 10d. per lb.
 Sod. Sulphide.—Pure recryst. 10d.—1s. 2d. per lb.
 Sod. Sulphite, anhydrous.—£27 10s.—£28 10s. per ton
 according to quantity, delivered U.K.
 Sulphonol.—6s. 9d.—7s. per lb.
 Tartar Emetic B.P. cryst. or powder.—2s. 1d.—2s. 3d. per lb.
 Thymol, Puriss.—10s.—10s. 3d. per lb., according to
 quantity. Natural.—14s. 3d. per lb.

PERFUMERY CHEMICALS

Acetophenone.—7s. per lb.
 Aubepine (*ex Anethole*).—11s. per lb.
 Amyl Acetate.—2s. per lb. Amyl Butyrate. 5s. 3d. per lb.
 Amyl Salicylate.—3s. per lb.
 Anethole (M.P. 21/22° C.).—5s. 6d. per lb.
 Benzyl Acetate from Chlorine-free Benzyl Alcohol.—2s.
 per lb. Benzyl Alcohol free from Chlorine.—2s. per lb.
 Benzaldehyde free from Chlorine.—2s. 6d. per lb. Benzyl
 Benzoate.—2s. 6d. per lb.
 Cinnamic Aldehyde.—Natural, 16s. 6d. per lb.
 Coumarin.—10s. per lb.
 Citronellol.—13s. 3d. per lb.
 Citral.—8s. 3d. per lb.
 Ethyl Cinnamate.—6s. per lb.
 Ethyl Phthalate.—3s. per lb.
 Eugenol.—8s. 3d. per lb. Geraniol (Palmarosa).—17s. 9d.
 per lb. Geraniol.—6s.—10s. per lb. Heliotropine.—
 4s. 9d. per lb. Iso Eugenol.—13s. per lb. Linalol.—
 (*ex Bois de Rose*) 14s. per lb.—(*ex Shui Oil*) 9s. 9d. per lb.
 Linalyl Acetate.—(*ex Bois de Rose*) 17s. 6d. per lb.—
 (*ex Shui Oil*) 13s. 9d. per lb.
 Methyl Anthranilate.—8s. 6d. per lb.
 Methyl Benzoate.—4s. per lb.
 Musk Ketone.—35s. per lb.
 Musk Xylol.—8s. per lb.
 Nerolin.—4s. 6d. per lb.
 Phenyl Ethyl Acetate.—12s. per lb.
 Phenyl Ethyl Alcohol.—10s. 6d. per lb.
 Rhodinol.—31s. 6d. per lb. Safrol.—1s. 6d. per lb. Terpeneol.
 —1s. 8d. per lb. Vanillin.—15s. 3d.—16s. 6d. per lb.

ESSENTIAL OILS

Almond.—Foreign S.P.A., 11s. per lb. Anise.—2s. 9d. per lb.
 Bergamot.—26s. per lb. Bourbon Geranium.—13s.
 per lb.
 Camphor.—9d. per lb. Cananga, Java, 15s. 9d. per lb.
 Cassia, 80/85%.—7s. 3d. per lb. Cinnamon, Leaf.—6d.
 per oz. Citronella.—Java, 1s. 9d. per lb., c.i.f. U.K.
 port, for shipment over 1928; Ceylon, Pure, 1s. 7d.
 per lb. Clove, pure 5s. per lb.
 Eucalyptus, Australian.—2s. 1d. per lb. Lavender.—Mont
 Blanc, 38/40%, 17s. per lb. Lemon.—8s. 6d. per lb.
 Lemongrass.—4s. 6d. per lb. Orange, Sweet.—11s. 3d.
 per lb. Otto of Rose.—Anatolian, 35s. per oz., Bulgarian,
 75s. per oz. Palma Rosa.—10s. 3d. per lb. Peppermint
 —Wayne County, 16s. 9d. per lb. Japanese, 8s. per
 lb. Petitgrain.—7s. 9d. per lb. Sandalwood—Mysore,
 26s. 6d. per lb., 90/95%, 16s. 6d. per lb.

PATENT LIST

The complete Specifications notified as accepted are open to inspection at the Patent Office immediately, and to opposition not later than Feb. 20th, 1928. They are on sale at 1s. each at the Patent Office Sale Branch, Quality Court, Chancery Lane, London, W.C.2, on Jan. 5th, 1928. Complete Specifications marked * are those which are open to public inspection before acceptance. The remainder are those accepted.

I.—Applications

Beurrier. Centrifugal separators. 33,927. Dec. 15. (Fr., 15.12.26.)
 Brayshaw. Conveyor furnaces. 33,937. Dec. 15.

Fitch. Heating-furnaces. 34,260. Dec. 17. (U.S., 18.12.26.)
 Green. Apparatus for filtering fluids. 33,765. Dec. 14.
 Iva Alti Forni e Acciaierie d'Italia, and Aurelj. Furnaces. 33,511. Dec. 12.
 Korot. Grinding-mills. 33,609. Dec. 12.
 Parker, Winder, & Achurch, Ltd., and Smith. Mixing-machines. 33,576. Dec. 12.
 Soc. L'Air Liquide. Carrying out exothermic chemical reactions. 33,743. Dec. 13. (Fr., 24.12.26.)
 Vernay. Rotary drying-apparatus. 34,128. Dec. 16. (Fr., 18.12.26.)
 Vigers and Woodward. Rendering porous materials resistant to chemicals. 33,657. Dec. 13.

I.—Complete Specifications

19,644 (1926). Baume, Chambige, and Boutier. Preparation of emulsions or suspensions. (262,724.)
 22,675 (1926). Wright. Apparatus for drying. (281,785.)
 28,745 (1926). Johnson (L.-G. Farbenind.). Apparatus for stirring and mixing. (281,852.)
 352 (1927). Habermann. Centrifugal driers and separators. (265,561.)
 5389 (1927). Easterbrook, and Brown & Son (Alembic Works), Ltd. Mixing and stirring apparatus. (281,904.)
 11,600 (1927). Kocour. Apparatus for determining strength of solutions. (270,338.)
 15,353 (1927). Wright. Apparatus for effecting intimate contact of gases and liquids. (281,958.)
 16,395 (1927). Krupp Grusonwerk. Apparatus for expressing liquid constituents from materials. (273,294.)
 21,453 (1927). Fesen. Centrifugal separators and driers. (278,327.)
 *17,009 (1927). Maschinenfabr. Beth. Bag filters. (281,994.)

II.—Applications

Burne. Briquetting fuel. 34,112. Dec. 16.
 Carpenter, and South Metropolitan Gas Co. Operating gas-producers etc. 34,119. Dec. 16.
 Coppée et Cie. Coke oven. 34,164. Dec. 16. (Belg., 26.7.27.)
 L.-G. Farbenind. Manufacture of hydrocarbons poor in hydrogen. 33,562. Dec. 12. (Ger., 3.1.27.)
 Johnson (L.-G. Farbenind.). Production of olefines etc. 33,849. Dec. 14. Conversion of hydrocarbons. 33,850. Dec. 14. Oxidation of hydrocarbons. 34,227. Dec. 17.
 Jones. Carbonisation of coal etc. 33,602. Dec. 12.
 Koppers Co. Gas purification. 34,139. Dec. 16. (U.S., 22.1.27.)
 Coke ovens. 34,143 and 34,145. Dec. 16. (U.S., 29.1.27 and 12.2.27.)
 Parker. Extracting volatile constituents from carbonaceous materials. 33,900. Dec. 14. (U.S., 14.12.26.) Retorts. 33,902-4. Dec. 14. (U.S., 14.12.26.)
 Uhlmann. Manufacture of briquettes. 33,586. Dec. 12. (Ger., 11.12.26.)

II.—Complete Specifications

22,193 (1926). Spatz. Distilling crude oil from shale. (281,769.)
 27,431 (1926). Karrick. Distillation of carbonaceous material. (261,362.)
 27,836 (1926). Deutsche Bergin A.-G. Elaborating the products arising during liquefaction of coal by hydrogenation. (262,738.)
 5061 (1927). Hoyois. Washing coal, ores and like substances. (266,725.)
 6086 (1927). Soc. Internat. des Proc. Prudhomme Houdry. Hot desulphurisation of gases derived from distillation or pyrogeneration of combustibles. (267,138.)
 *31,280 (1927). Humphreys & Glasgow, Ltd. Apparatus for making carburetted water-gas. (282,034.)
 *33,272 (1927). Siemens & Halske A.-G. Determining the content of combustible gas in gas mixtures. (282,080.)

*33,586 (1927). Uhlmann. Manufacture of briquettes. (282,104.)

IV.—Applications

British Celanese, Ltd., and Ellis. Manufacture of dyestuffs. 33,683. Dec. 13.

Carpmael (I.-G. Farbenind.). Manufacture of compounds containing sulphur. 33,621. Dec. 12. Manufacture of dyestuffs. 33,704. Dec. 13.

I.-G. Farbenind. Manufacture of azo dyestuffs. 33,619. Dec. 12. (Ger., 13.12.26.) Manufacture of arylaminonaphthalene derivatives. 33,719. Dec. 13. (Ger., 13.12.26.) Manufacture of dyestuffs. 33,870. Dec. 14. (Ger., 14.12.26.) Production of vat dyestuffs. 34,226. Dec. 17.

Inmay (I.-G. Farbenind.). Manufacture of 2:3-amino-naphthol etc. 33,992. Dec. 15. Manufacture of azo dyestuffs. 34,116. Dec. 16.

Johnson (I.-G. Farbenind.). Production of 4'-halogen-2-benzoylbenzoic acid etc. 33,848. Dec. 14.

State Import & Export Trading Office Gostorg, and Kis-litzin. Manufacture of black colouring matter. 34,018. Dec. 15.

IV.—Complete Specifications

22,154 (1926). British Dyestuffs Corp., Baddiley, Chorley, and Brightman. Secondary disazo dyes. (281,767.)

23,162 (1927). British Dyestuffs Corp., Payman, and Wignall. Manufacture of derivatives of 2:3-hydroxynaphthoic arylides. (281,795.)

*22,689 (1927). Newport Co. Para-amino-ortho-benzoylbenzoic acid, and process of making same. (282,001.)

*23,771 (1927). I.-G. Farbenind. Manufacture of anthraquinone derivatives. (282,004.)

*33,355 (1927). Fabr. de Produits de Chimie Organique de Laire. Manufacture of primary anines. (282,083.)

*33,619 (1927). I.-G. Farbenind. Manufacture of azo dyestuffs. (282,107.)

*33,719 (1927). I.-G. Farbenind. Manufacture of arylaminonaphthalene-derivatives. (282,111.)

V.—Applications

Bahre. Treatment of fibres. 33,776—7. Dec. 14.

British Celanese, Ltd., and Kinsella. Apparatus for manufacture of artificial silk. 34,223. Dec. 17.

Dreyfus. Manufacture of artificial fibres etc. 33,915—7. Dec. 15. Manufacture of cellulose derivatives. 34,291—3. Dec. 17.

Grunert. Spinning artificial filaments etc. 34,129. Dec. 16. (Ger., 24.12.26.)

Lindner. Production of cleaning etc. agents. 33,844. Dec. 14.

V.—Complete Specification

10,499 (1927). Inmay (I.-G. Farbenind.). Manufacture of esters of the cellulose series. (281,927.)

VI.—Applications

Carpmael (I.-G. Farbenind.). Dyeing cellulose derivatives. 33,703. Dec. 12. Manufacture of solutions for dyeing. 33,707. Dec. 13.

Petrie, and Petrie & McNaught, Ltd. Machines for wet treatment of yarns. 34,014. Dec. 15.

Sandoz Chemical Co., Ltd., and Woodhead. Dyeing cotton materials. 34,261. Dec. 17.

VI.—Complete Specifications

10,952 (1927). I.-G. Farbenind. Dyeing and printing cellulose esters and ethers. (269,934.)

*23,147 (1927). Arnold Print Works. Treatment of cellulose fabrics. (282,002.)

*31,486 (1927). British Celanese, Ltd. Dyeing textile fibres etc. (282,036.)

VII.—Applications

Carpmael (I.-G. Farbenind.). Manufacture of cyanides. 33,708. Dec. 13.

Croad (Hanovia Chem. & Manuf. Co.). Removal of cupric oxide. 33,828. Dec. 14.

Gerrard, and Reid Processes, Ltd. Burning limestone etc. 34,118. Dec. 16.

Inmay (I.-G. Farbenind.). Manufacture of alkali metal salts. 33,994. Dec. 15.

Smith. 33,570. See X. Manufacture of lead peroxide. 33,715. Dec. 13.

Soc. Gén. Métallurgique de Hoboken. Manufacture of sulphuric acid. 34,039 and 34,081. Dec. 15 and 16. (Ger., 23.2.27.)

VII.—Complete Specifications

26,053 (1926). Haworth and Nelson, Ltd. Concentrating aqueous solutions of acetic or formic acid. (281,827.)

8894 (1927). Colombo y Manni. Chambers for the manufacture of sulphuric acid. (270,661.)

*32,705 (1927). I.-G. Farbenind. Producing carbon disulphide. (282,049.)

VIII.—Applications

Atel, Haurez, and Motte. Ovens for ceramic products. 33,812. Dec. 14.

Hochbert. Manufacturing refractory articles of clay. 33,580. Dec. 12.

Singer. Production of artificial plagioclase compounds. 33,851. Dec. 14. (Ger., 17.12.26.) Treatment of ceramic materials. 33,852. Dec. 14. (Ger., 17.12.26.) Preventing ageing of ceramic materials. 33,853. Dec. 14. (Ger., 18.12.26.)

IX. Applications

Cookson. Building etc. material. 34,010. Dec. 15.

Knibbs. Production of cement. 34,158. Dec. 16.

Magure. Treating stone, cement, etc. 34,130. Dec. 16.

Vitalba. Manufacture of Portland cements etc. 33,682. Dec. 13.

IX.—Complete Specification

21,975 (1926). Oakley. Manufacture of artificial stone and plaster. (281,757.)

X. Applications

Croad (Hanovia Chem. & Manuf. Co.). Production of crystalline cuprous oxide upon copper surfaces. 33,830. Dec. 14.

Eisen u. Stahlwerk Hoersch, and Heidenham. Hardening substances of iron, steel, etc. 34,236. Dec. 17. (Ger., 28.12.26.)

I.-G. Farbenind. Manufacture of porous metals. 33,721. Dec. 13. (Ger., 13.12.26.) Manufacture of metal catalysts. 33,871. Dec. 14. (Ger., 14.12.26.)

Nelissen. Preparing articles for nickel plating. 34,212. Dec. 17. (Belg., 30.12.26.)

Smith. Reduction of metallic oxides. 33,570. Dec. 12.

Stahlwerk Becker. Manufacture of steel. 34,001. Dec. 15. (Ger., 30.12.26.)

Stephens (Vulcan-Feuering A.-G.). Cupola furnaces. 34,124. Dec. 16.

Verein, Stahlwerke A.-G. Annealing carbon-containing iron etc. 33,583. Dec. 12. (Ger., 8.1.27.)

X.—Complete Specifications

17,038 (1926). Dietzsch. Treatment of ores of copper and other metals. (281,741.)

22,143 and 32,015 (1926). Smith, Garnett, and Holden. Magnetic alloys. (281,763.)

23,316 (1926). Gustafson. Hardening copper and copper alloys. (281,799.)

27,598 (1926). McGuinness. Furnaces for roasting ores. (281,837.)

- 29,351 (1926). Wittke. Reducing zinc ores. (279,370.)
 5061 (1927). Hoyois. See II.
 7429 (1927). Hall and Bradbury. Aluminium alloy. (281,912.)
 13,863 (1927). Soc. Gén. Métallurgique de Hoboken. Roasting zinc sulphide ores. (271,877.)
 14,611 (1927). Kelly. Alloys. (281,950.)
 16,968 (1927). Johnson (I.-G. Farbenind.). Manufacture of pure iron. (281,963.)
 24,543 (1927). Cozens, and Metallization, Ltd. Coating materials by metal-spraying. (282,116.)
 *28,021 (1927). Krupp A.-G. Raising the yield point of steel alloys. (282,015.)
 *29,255 (1927). Rhenania-Kunheim Ver. Chem. Fabr. Dissociating zirconium ores. (282,023.)
 *32,375 (1927). Broken Hill Proprietary Co. Blast furnaces (282,042.)
 *33,484—5 (1927). Manos. Alloys. (282,095 6.)
 *33,721 (1927). I.-G. Farbenind. Manufacture of finely-porous metals. (282,112.)

XI.—Applications

- Beatty (Bell Telephone Laboratories). Production of insulating materials. 34,043. Dec. 15.
 Berliner Batterie-Fabrik. Electric batteries. 34,265. Dec. 17. (Ger., 13.4.27.)
 Crond (Hanovia Chem. & Manuf. Co.). Securing electrical contact with crystalline cuprous oxide. 33,831. Dec. 14.
 Pritchett, and Pritchett & Gold & E.P.S. Co., Ltd. Electric accumulators. 34,090 1. Dec. 16. (Ger., 16.12.26.)
 Soc. Electro-Métallurgique de Montricher. Electric furnaces. 34,199. Dec. 17. (Fr., 28.12.26.) Electrodes. 34,200. Dec. 17. (Fr., 21.12.26.)

XI.—Complete Specifications

- 22,196 (1926). Joel. Electric secondary batteries or accumulators. (281,770.)
 *33,105 (1927). British Thomson Houston Co. Filaments for incandescent lamps etc. (282,066.)
 *33,501 (1927). Mallon. Electric accumulators. (282,100.)

XII.—Applications

- Erba A.-G. Manufacture of Turkey-red oils etc. 33,976. Dec. 15. (Ger., 28.7.27.) Manufacture of highly sulphated oils. 33,977. Dec. 15. (Ger., 23.6.27.)

XII.—Complete Specifications

- 19,644 (1926). Baume, Chambige, and Boutier. See I.
 2894 (1927). Petroff. Treating drying and semi-drying fats and oils. (281,896.)

XIII.—Applications

- Bakelite Ges. Production of phenol-aldehyde condensation products. 33,897. Dec. 14. (Ger., 14.12.26.)
 Soc. Anon. La Fibre Diamond. Manufacture of synthetic resin. 34,163. Dec. 16. (U.S., 16.12.26.)

XIII.—Complete Specification

- *16,079 (1927). Schmidt. Production of artificial materials from condensation products of urea with formaldehyde etc. (281,993.)

XIV.—Application

- Goodyear Tire & Rubber Co. Preparation of rubber. 34,149. Dec. 16. (U.S., 11.2.27.)

XIV.—Complete Specification

- *26,342 (1927). Naugatuck Chemical Co. Treating rubber latex. (282,011.)

XV.—Applications

- Carpmael (I.-G. Farbenind.). Stuffing leather. 33,795. Dec. 13.
 Greiner. Production of solid glue etc. 34,222. Dec. 17. (Ger., 28.3.27.)
 Ilford, Ltd., and Shepherd. Concentrating gelatin etc. 33,595. Dec. 12.

XV.—Complete Specifications

- 8191—2 (1927). Ehrenreich. Preparation of skins of fish, in particular of sharks, for tanning. (281,918—9.)

XVI.—Application

- Imperial Chem. Industries, Ltd., and Shale. Fertilisers and manufacture thereof. 33,655. Dec. 13.

XVII.—Applications

- Blanker. Manufacture of sugar. 34,003. Dec. 15. (Ger., 8.1.27.)

- Nouvelles Industries Chimiques. Recovery of nitrogen from vinasses etc. 34,174. Dec. 16.

XVII. Complete Specification

- 24,953 (1926). Howard, Ltd., and Rowland. Apparatus for diffusing sugar beet etc. (281,813.)

XIX.—Applications

- Nyrop. Production of fodder etc. 33,895. Dec. 14.
 Manufacture of cream powders. 33,896. Dec. 14.
 Stabback. Preservation of edible products. 33,747. Dec. 13.

XIX.—Complete Specifications

- 25,739 (1926). I.-G. Farbenind. Treating out seed to destroy smut spores. (275,539.)
 *33,107 (1927). Chem. Fabr. Schlutup. Leaching out protein-containing substances such as fish waste. (282,068.)
 *33,394 (1927). Massard. Producing an almond-milk product. (282,088.)

XX. Applications

- Boedecker. Preparation of monoalkyl ethers. 33,971. Dec. 15.

- I.-G. Farbenind. Manufacture of 6-alkoxy-8-amino-quinolines. 33,620. Dec. 12.

- Imray (I. G. Farbenind.). Manufacture of orthoamino-diaryl ethers. 33,993. Dec. 15. Manufacture of oxy-diarylketones. 34,117. Dec. 16.

- Schering-Kahlbaum A.-G. Manufacture of alkyl- β -halogen-ethyl ketones. 33,881. Dec. 14. (Ger., 15.12.26.) Manufacture of metal etc. mercapto acid esters. 34,051. Dec. 15. (Ger., 16.12.26.)

XXI.—Application

- Burg, and Schwickerk Ges. Treating light-sensitive layers. 34,132. Dec. 16. (Ger., 26.1.27.)

XXI.—Complete Specification

- *8071 (1927). Grinten. Manufacture of photographic sensitive layers. (281,604.)

GENERAL NOTES

Official Trade Intelligence

The Department of Overseas Trade (Development and Intelligence), 35, Old Queen Street, London, S.W.1, has received the following inquiries for British goods. British firms may obtain further information by applying to the Department and stating the specific reference number:—*British India*: Bleaching and dyeing plant (502); 1330 lb. bismuth carbonas B.P.; 580 lb. bismuth salicylas B.P. and 4420 lb. bismuth subnitrates B.P.; 1040 lb. iodoformum B.P. and 1625 lb. iodum B.P.; 31,900 lb. glycerinum B.P. (Director-General, India Store Department, Branch No. 10, Belvedere Road, Lambeth, S.E.1). *Canada*: Branded coal tar disinfectant (504); leather (505). *Egypt*: Two centrifugal pumping sets (A.X. 5691); alum. (B.X. 4092). *Holland*: Raw and technical materials for pastrycooks and bakers (515). *Rumania*: Leather (519). *Turkey*: Centrifugal pump (A.X. 5683). *United States*: (Crockery, glassware (524)

Safeguarding of Key Industries

The Board of Trade gives notice that representations have been made to it under Section 10 (5) of the Finance Act, 1926, regarding the exemption of metaldehyde from the Safeguarding duty. Communications should be addressed to the Principal Assistant Secretary, Industries and Manufactures Department, Board of Trade, Great George Street, S.W.1. before January 23, 1928.

Beet Subsidy

According to a supplementary estimate issued on December 9, an additional £900,000 is required to pay the beet-sugar subsidy during this financial year. The amount of the original estimate was £4,500,000, but this has been found to be insufficient.

New Branch of Brotherton & Company, Ltd.

With a view to giving their customers in Lancashire even more efficient service than hitherto, and ensuring quick despatch of all orders, Messrs. Brotherton & Co., Ltd., are opening an office on Monday, January 2, 1928, at 53, King Street, Manchester. The Manchester Branch, controlling local stocks of Hydrosulphites, etc., will be under the management of Mr. F. T. Cutler, and with him will be associated the present traveller, Mr. R. B. Penrose.

Scottish Dyes, Ltd.

The 1928 diary of Scottish Dyes, Ltd., reminds us that during 1927, this firm produced 12 new colours, comprising 9 Caledon colours, Soledon Dark Blue, Solway Chrome Green and Celatene Blue. The diary contains in addition to the usual diary and space for notes, much useful information about the properties, application and identification of the Caledon, Solway, Celatene and Soledon colours. It is interesting to note that Caledon colours are now prepared in special form under the name of "Caledon Dye-cretes" for colouring concrete, either by mixing with the gauging waters or by application as a wash after dilution with water.

News from Advertisements

Applications are invited from chemists of eminence for the post of principal of the Technological Institute, Cawnpore (p. vi of issue of December 16, 1927).

The Senate of the University of London invites applications for the Ramsay Memorial Chair of Chemical Engineering tenable at University College (p. vi of issue of December 23, 1927).

There are now 129 firms represented in our Buyers' Guide.

BRITISH INDUSTRIES FAIR 1927 SUPPLEMENT

DESIGNERS AND BUILDERS OF SOUND PLANT FOR NEARLY 100 YEARS

YOUR
exact
need

IT IS EXTREMELY improbable that the plant you need will be found in our catalogues. We illustrate hundreds of types of plant - from the simplest unit to the most intricate complete chemical plant - and each illustration is something that we ourselves have made.

But these are only types. The plant you need is an individual. When you order plant from Dagenham we shall study the requirements of your process - we shall design the plant in exact relation to those requirements - then we shall build it with the knowledge and experience of nearly a century's specialisation.

For thus do we attempt supremely sound chemical plant..

BRITISH INDUSTRIES FAIR

February 21—March 4, 1927

CHEMICAL SECTION.

The British Industries Fair, organised by the Department of Overseas Trade, is again being held at the White City, Shepherd's Bush, London, and once more chemical industry will be housed in the same commanding position at the Shepherd's Bush entrance in Hall "A," which has become known as the Chemical Hall, because it has been utilised so often for the chemical exhibits. The Association of British Chemical Manufacturers, which, like all our most valued organisations, has achieved the dignity of a short title, and is known familiarly as the A.B.C.M., has again made itself responsible for this representation of the industry. A number of new and interesting products will be exhibited, and there will be abundant evidence of the steady advance of the fine chemical industry, whilst the heavy chemical industry will prove that it is no less alert to modern tendencies and developments.

When we visited the Fair, preparations were proceeding apace for the opening, and though all we saw comprised busy workers and stands, some finished and draped, some nearly finished, some in process of acquiring their decorations of figure and fact, there could be no possible doubt that the stand of the great company which we now know as Imperial Chemical Industries, Ltd., will be the dominating feature of the Chemical Section. We have called it a stand, but it is rather an edifice, erected to the glory of chemical industry, and when the public sees the rich effect which has been produced with the aid of the combined products of the British Dyestuffs Corporation, Brunner, Mond & Co., Nobel Industries, Ltd., and the United Alkali Company, they will agree that the architect, Mr. Joseph Emberton, has been properly inspired by his great theme. Such a great organisation is exceedingly difficult to represent, but the trade buyer and the general public alike—the Fair is open to the public in the evenings—will be able to grasp the enormous scope of Imperial Chemical Industries. At each end of the stand is a semicircular series of steps, one end being occupied by an immense and fascinating flow-sheet, which shows the intricate series of products derived from raw materials such as air, limestone, coal and brine, all materials of which the company has abundant supplies. Jars containing specimens are linked up with coloured threads so that all may see the infinite variety of essential products controlled by the company. At the other end there will be exhibits of fertilisers by Nitram, Ltd. (the selling agents to the Sulphate of Ammonia Federation), complete with a little field and model cows to illustrate the value of manuring grassland. The fertilisers will include superphosphate and compound fertilisers, and nitrogenous fertilisers will speak of Billingham. The manufacture of an orange dye will be demonstrated by the

British Dyestuffs Corporation, using two colourless intermediates, and the demonstration will include salting out, filtration, and the dyeing of silk with the dried dye. Nobel Industries will provide a general display of the uses of nitrocellulose, of ammunition, and other of their well known products. The central hall of the edifice will be rich with fabrics and colours which will speak of colours from the British Dyestuffs Corporation, cellulose varnishes and metallic powders from Nobels, and paints and varnishes from Naylor Brothers (who are now associated with Nobels). The furniture will express Nobel varnishes, Rexine and Pegamoid artificial leather; indeed, as far as is possible in the space, the manufactures of Imperial Chemical Industries will be expressed in concrete form. The activities of such an organisation cannot be described in such a limited space as this, but there is no real difficulty, as Stands 10 and 17 in the Chemical Section provide a convincing demonstration of the strength and scope of this new union in the chemical industry. Further, a handsome book will be available, containing not only a fascinating article by Sir Alfred Mond on the history of the company, but an interesting account of its world-wide activities.

Thanks to the courtesy of the various exhibitors, we are able to give an account of the stands in the Chemical Section. The different stands are dealt with in alphabetical order.

Acme Chemical Co., Ltd.

On Stand No. A. 28, this Tonbridge firm is exhibiting insecticides for agricultural and horticultural purposes, amongst which may be noted arsenite of soda (powder and paste) for the dipping of cattle and for the destruction of locusts, white ant poison, and arsenate of lead, which is used upon cotton plants, tobacco plants, fruit trees, and so on. Amongst other products of this firm are weed killer, lawn sand, and worm killer for golf courses.

Frederick Allen & Sons (Poplar), Ltd.

On Stand A. 2 will be seen the pure inorganic chemicals manufactured by this Poplar firm, including specialities such as Epsom salts, which are claimed to be second to none in quality and appearance, calcium chloride exsicc., ferri. sulph. exsicc., and other exsiccated salts. There will also be hydrochloric, sulphuric and nitric acids of special purity for research work, liquid ammonia, and pure chemicals for pharmaceutical, photographic and analytical purposes. Of heavier chemicals, this firm manufactures sal acetos and oxalates of all kinds, such as manganese oxalate, sodium oxalate, ammonium oxalate, copper oxalate and the like, as well as potash sulphuret, fertilisers and insecticides, from which representative exhibits will be chosen.

To READ is to SAVE

—for each Sofnol product has been specially developed to introduce a definite economy. With each one is bound up a saving in time, labour, materials, — increased exactitude — reduced ultimate cost.

These booklets not only describe our products, but cover the field of their application. In fact, they give [the reason for Sofnol lime products and analytical reagents. The titles are (1) "Calcium Hydrate," (2) "Water Testing," (3) "The Chemistry of Water Softening," (4) "Soda Lime," (5) "Sofnolite (Gravimetric CO_2 Absorbent)," (6) "Indicators" for Accurate Titration."

Now, please let us know which of these free booklets you would like us to post to you. Let us send you any of them that bear on your work. Our organisation is at your service. If you use steam, if you use lime, if you have a laboratory

TAS/S1,5

When writing to Advertisers, please mention "Chemistry and Industry."

Albright & Wilson, Ltd.

This firm, which, we are under the impression, will be found in the same position as at the last Fair—on Stands 13 and 14, opposite the entrance to the Chemical Section—is to make an interesting display of "Silicon Ester," to demonstrate its value in the preservation of stonework. This firm is known the world over for its phosphorus (of which it is the sole manufacturer in the British Empire), phosphorus compounds, and acid calcium phosphate, and these will be on show with the Ibex and Antelope brands of aerating materials. Last year this exhibit included interesting specimens of technical and pure carbon tetrachloride, ammonium persulphate, pure precipitated sulphur, and other important products, amongst which we remember crystal sticks of pure phosphoric acid, which is being used as a substitute for various organic acids.

A. Boake Roberts & Co., Ltd.

In view of the rapidly extending applications of cellulose lacquers, special interest attaches to the stands (Nos. A. 8 and A. 19) of Messrs. Boake Roberts & Co., who manufacture a complete range of all the solvents, plasticisers and artificial resins which are required for the preparation of these lacquers. A wide range of these materials, for which particularly high quality is required, will be shown, and cellulose acetate of a very high grade will be included. The most recent products of the firm in this class of chemicals are diacetone alcohol, diamyl phthalate, and pale glycerin resin ester.

The firm is now producing about 240 fine chemicals, compared with five in 1914, the latest additions being 100% heliotropin, cineole, safrol, citronellol prepared by a new process, and synthetic menthol in dry, detached crystals. The exhibit will include a range of fine chemicals of the nature of synthetics, isolates and terpeneless essential oils. There will be some interesting intermediates, types of peppermint oil suitable for all applications; compounded perfumes suitable for soap and similar application, and a wide range of flavouring essences, essential oils and colours for edible purposes. Liquid sulphur dioxide in cylinders, sulphites, bisulphites and metabisulphites, and phosphates of a high degree of purity will also be on view.

Boots Pure Drug Co., Ltd.

On Stand A. 6 this firm will provide not only an exhibit of its saccharin, chloroform, alkaloids and other pharmaceutical products, but will display an imposing series of research chemicals and large samples of cyanacetic ester, diethyl malonate, and hydroxylamine hydrochloride. It is interesting to note that Messrs. Boots propose to exhibit some rare chemicals which have never been shown before.

British Drug Houses, Ltd.

The most striking feature of this exhibit (Stands Nos. A. 11 and A. 16) is the section devoted to synthetic and other fine chemicals, used in medicine and in research and general laboratory work, manufactured by this company. The presence of such compounds as both natural and synthetic thyroxine, and of the intermediate products made in the course of the production of the

latter, as well as of many other organic medicinal products as, for instance, phenol-tetraiodophthalein, the non-toxic dye used in cholecystography, and ephedrine, the alkaloid used in the new method of treating asthma, bears witness to the fact that the B.D.H. directors are almost in advance of the times. Indeed, the whole exhibit demonstrates that the company intends to do its share in maintaining British prestige in the fields of chemical research and industry.

In addition to the products mentioned above, examples which, among the large number exhibited, will attract special attention are the Borocaines, the new, non-toxic local anaesthetics; Caprokol (hexylresorcinol), which is a remarkable urinary antiseptic; ether puriss. B.D.H., a comparatively new product, which is the result of researches carried out in the B.D.H. laboratories with the object of making an absolutely pure and perfectly stable anaesthetic ether, free from peroxides, but which costs no more than ordinary anaesthetic ether; contramine and thiohistamine, organic sulphur compounds used in treating various infections; and, of course, insulin. The British Drug Houses, Ltd., were the pioneers in Great Britain of the manufacture of insulin, their insulin plant being acknowledged to be second to none, and it is interesting to note that this brand of British insulin is now exported to every part of the civilised world. The samples of pituitary extract will testify to the company's enterprise in developing the manufacture of organo-therapeutic products, and there will be new additions to the B.D.H. list of alkaloids, including ephedrine. Last, but not least, there will be a comprehensive display of B.D.H. laboratory fine chemicals, of which the number exceeds 3500 and is being added to daily, and there will be a range of indicator dyes for the determination of hydrogen-ion concentration, of microscopic stains, and specimens of specialities such as acriflavine, tetraform, pure glucose and lactose, medicinal colloidal solutions and many others. Recent advances in our knowledge of nutrition and of the vitamins have drawn attention to the important significance of cholesterol, with the result that it is being employed in several directions in medicine, as well as in experimental work relating to vitamins. As a final example of the enterprise of the British Drug Houses, Ltd., it may be stated that the manufacture of cholesterol has been undertaken in recent months by the firm, which can now supply cholesterol in a pure crystalline condition.

W. J. Bush & Co., Ltd.

There is much of romance in the Chemical Section for those who know something of chemistry and chemical industry, but to the ordinary man a most direct appeal is made by Stand A. 7, at which Messrs. W. J. Bush & Co., Ltd., are exhibiting. This firm's exhibit may be divided into the main groups, first, that consisting of essences, essential oils and perfumes, and second, fine chemicals and cream of tartar. In a twinkling one is translated from Hackney to the lemon groves of Sicily, for this firm is world-renowned for the highest-grade fruit essences and perfumery, and is showing some of its leading specialities. For example, essential oil of lemon, produced at their Messina and Californian factories;

MANUFACTURERS WHO SPECIALISE MAKE THE GREATEST APPEAL TO BUYERS

Exhibit, therefore, in the
SPECIALISED TRADE EXHIBITION
DEVOTED TO YOUR INDUSTRY:—

The INTERNATIONAL OIL, CHEMICAL AND COLOUR TRADES EXHIBITION

Royal Agricultural Hall, London.

June 11th to 18th, 1927.

peppermint, distilled at their Mitcham factory; and various fruit essences. Prominent among fine chemicals is vanillin, of which this company is the oldest British maker. Coumarin, thymol, ionone and many others are also exhibited. Certain important intermediates for dye manufacturers are shown, prominent among which are salicylic acid, aceto-acetic ester, sulphanilic acid and benzoyl chloride. Among synthetic drugs are salicylic acid, sodium salicylate, acetanilide and methyl salicylate. The comparatively new industry of nitrocellulose varnishes and polishes is being catered for in the production of a range of solvents, of which ethyl, butyl, and amyl acetates are important examples. Plasticisers are also exhibited.

Joseph Crosfield & Sons, Ltd.

A unique example of the skill with which the soap maker meets the world's every need for cleansing materials will be seen on Stand A. 22, that of Joseph Crosfield & Sons, Ltd., of Warrington. In household soaps alone there are Crescent, Umbrella, Camel, Guardian Pink, and Rainbow Carbolic soap, which are designed to meet every domestic or institutional need. There are various qualities of bar soap, mottled soap, a series of toilet soaps and Glitto, a well-known polishing powder which finds use not only on inanimate things in the home, but is very efficacious in removing dirt and grease from the hands. In addition to Glitto, there will be seen "Feather Flakes," "Carbosil," and "Persil," products familiar to all. In the midst of such a profusion of cleansing materials, it should not be forgotten that though Messrs. Crosfield apply their "Pyramid" brand to soap, it also applies to the firm's silicate of soda as glass or in solution, or that caustic soda, glycerine, cement, and doucil—a base-exchanging and vapour-absorbing material—are also important products of the firm. All these manufactures will be displayed in addition to the remarkable range of soaps.

The Erasmic Co., Ltd.

On their stand No. 21—the Erasmic Company will include the well-known Peerless Erasmic soap, and will introduce for the first time a complete series of toilet necessities to complete the line. The full series so greatly are we indebted to the arts of the soap maker comprises soap, perfume, face powder, lip stick, "poudre compacte," vanishing cream, bath crystals, shaving sticks, shaving cream, and shaving powder. Of interest also will be the Himalaya Bouquet Series, and the series of toilet articles presented under the title of "Old London Lavender Water." A particular feature of this display will be the artistic presentation of the products in well-designed and attractive containers.

Fletcher Miller, Ltd.

This firm describes itself as the "Engineers' Chemists," and on Stand A. 34 will be seen samples of the cutting and lubricating oils which the firm supplies to the engineering, textile and leather trades at home and abroad. The chief product is "Cooledge" water-soluble cutting oil, which is free from rosin, gumming materials or impurities, free from odour or sediment, economical in use, and is produced under the closest scientific supervision. An

interesting cutting and lubricating product is "Swift" oil, which contains sulphur in permanent suspension, while "Urtenol" is a combination of oils for the textile trades which possesses great penetrative and detergent properties, and enables operations to be simplified, thus increasing the output without danger of weakening the fibres. The use of "Urtenol" is recommended for all textile materials, whether in the caustic boil before bleaching in boiling off, or for wetting out before dyeing and mercerising. It is stated to remove weaving stains due to mineral oils, and prevent any discoloration during storage. "Sorbolene" is a fat liquor for the leather trades, and is used in the tanning and dyeing process to give greater elasticity to the leather and enable fuller shades to be obtained in dyeing.

Gas Light and Coke Company

The Gas Light & Coke Co.'s Products Works will again stage (Stand A. 12) a wide range of tar, ammonia, and cyanogen products, of which the company is the largest individual maker in the country. Road tar of established reputation and reliability is to the fore, and, when properly applied, stands above criticism concerning the alleged poisoning of streams and water-courses. We hear that an innovation is being made in the marketing of the tar this season, which will greatly facilitate its use in road surfacing work in the home counties. The exceptionally efficient distilling plant of the company enables them to make pure benzene and toluene, distilling within a fraction of 1° C., and xylene within 2°—the last-named is unusually high grade.

The phenol of this firm, besides being of good melting point, is noted for its non-reddening colour-keeping quality.

Liquid carbolic acid (cresols) really free from naphthalene, and giving a clear solution in caustic soda, is a standard production, and liquid carbolic acid (50% meta-cresol) is also manufactured. The pyridine bases to be shown are supplied in five grades, yielding 90% at 140°, 160°, 180°, 210° and 230° respectively. The naphthalene is of the best quality, well suited to dye manufacture. Beta-naphthol, free from alpha-naphthol, is a leading intermediate, and salicylic acid is also produced in technical and B.P. qualities.

The principal shades of Prussian blue will be exhibited upon a slowly rotating table, on which the colour will stand out amid the whiteness of naphthalene, the blackness of pitch, and the pallid green of refined anthracene.

Non-caking sulphate of ammonia will be shown as marketed in 2 cwt. bags and in bulk, and also in the small bags favoured in the Japanese market. Liquid ammonia made in all strengths up to saturation point will be on show. Let it be noted that the exhibit is lighted by "daylight" gas mantles, showing everything in its true colours.

The Graesser-Monsanto Chemical Works, Ltd.

When quality and price are equal, it is sometimes an advantage to have another criterion to help in the decision where an order shall be placed. There comes in the question of service. The Graesser-Monsanto Chemical Works, Ltd., having obtained a reputation second to none for quality, are making a special feature

of "service." The Graesanto Service Department is at the disposal of all their customers. The products of the firm include: Pure phenol, 40/41° C., pure cresols, and cresylic acids, uniform and standardised.

From phenol and cresol the firm manufactures such derivatives as salicylic acid, ortho-cresotinic acid, and both the ortho- and para-chlorophenols. From the technical salicylic acid is made a very attractive-looking B.P. salicylic acid of a high degree of purity, and an acetyl-salicylic acid B.P. of the highest quality and in three types—crystal, powdered and granular. The last-named is of special interest to tablet-makers, as it is possible to use it for tabletting without previous granulation. There are two other products which never escape notice—Vanillin-Monsanto and Saccharin-Monsanto. They both displace Nature's attempts at chemical production. Vanillin-Monsanto has the delicate aroma and true flavour of the vanilla bean: but it is 40 to 50 times stronger in flavouring strength, it is made under hygienic conditions in ideal surroundings, and every batch is guaranteed to be uniform in quality and strength. Vanillin-Monsanto has helped in making some of the world's most famous chocolates. Saccharin-Monsanto is known the world over; it is 550 times stronger than sugar, and, in addition, has the advantages of uniformity and purity. It saves labour and storage space, and is very economical in use.

Hopkin & Williams, Ltd.

This firm will show on Stand No. A. 32 their well-known chemical reagents for analytical and research purposes, prepared to specifications in their book, "Analytical reagents, standards and tests," which has passed several editions since it was published in 1911. This firm have been manufacturing fine chemicals since the middle of last century, and already before the late war were producing between two and three thousand articles of this description. Since then this number has been largely increased, and they are showing a few typical substances which will indicate the wide range of the work they are undertaking. Among the exhibits will be found adipic acid, cyclohexylchloride, methyl benzothiazole, hydrazine hydrochloride, nitroso-beta-naphthol, potassium hydrogen phthalate, mandelic acid, hippuric acid, glycine, and a number of organic sulphides and mercaptans. They are also manufacturing indicators used for hydrogen-ion determination, whilst another part of the chemical manufacture in which they specialise is the preparation of uranium salts. Chemical solutions for separation of mineral mixture—Clerici's solution, cadmium borotungstate, and so on—are also shown.

The company has also a branch established in Travancore, which exploits monazite sand and the accompanying sand ilmenite and zircon. Monazite sand products are dealt with by their associated company, Thorium, Ltd., at Ilford, who are showing a full range of thorium and the allied rare-earth salts. It should be noticed that this company has succeeded in establishing the rare-earth industry in England in spite of competition from abroad, and has provided a source of thorium free from foreign control for the incandescent mantle trade.

A by-product in the treatment of monazite sand is meso-thorium, which closely resembles radium, and is

much used in the preparation of luminous compounds for gun-sights, compass and watch dials, etc. Monazite sand contains only about the equivalent of 9 milligrams of meso-thorium per ton, but, notwithstanding this exceedingly minute proportion, Thorium, Ltd., succeed in extracting two-thirds or three-quarters of the total amount present. Specimens of self-luminous preparations are shown. A collection of cerium, lanthanum, neodymium and praseodymium salts are shown, some of which have already found application in various industries.

An interesting and valuable development is the use of ilmenite, which accompanies monazite in the sand deposits, as a source of white titanium pigment, used to replace zinc oxide and white lead in the manufacture of paint. The titanium pigment is a white substance comprised chiefly of titanium oxide which has a greater covering power than either zinc oxide or white lead, and is likely in the future very largely to displace white lead on account of its innocuous character.

As a by-product in the treatment of ilmenite, a very pure form of iron is obtained, quite free from silicon and titanium, which will probably find some important metallurgical application. The other chief mineral accompanying ilmenite, viz., zircon, is a source of zirconium oxide, a highly refractory substance used for the construction of furnace bricks and similar substances.

Howards & Sons, Ltd.

Howards & Sons, Ltd., of Ilford, who occupy Stand No. A. 5 in the Chemical Section, are one of the oldest established firms in the chemical trade. They were established in 1797 by Luke Howard, F.R.S., quaintly described in the public Press of that period as a "most respectable chymist" and a well-known figure in the scientific world of his day. At about this time the employees numbered about eight, and it is significant of the value placed upon the firm's products that the steadily increasing demand for "Howards' quality" has led to such expansion that the firm now employs over 500 chemists and workpeople, and the factory at Ilford covers over half a million square feet of floor space.

Among the fine chemicals the manufacture of which has contributed so much to the firm's reputation, specimens will be shown of Howards' quinine, first made by the firm over 100 years ago, and to-day the only quinine made in England; also of its salts and derivatives. Among other products of the firm may be mentioned benzoates, bromides, ethers, aspirin, iodides, mercurials, bismuths, caffeine, calcium lactate, calomel, camphor, cinchona preparations, Epsom and Glauber salts, iron salts, hydrogen peroxide, lithias, magnesias, synthetic menthol, pulv. seidlitz and soda tart., sodii bicarb., salicylates, medicinal spirits, syrup ferri. phosph., zinc salts, thymol, agotan, the great remedy for rheumatism, and medicinal tablets of all kinds.

It will be of interest to our readers to note the newer developments at Howards' Ilford factory. As the result of very considerable and costly work in their research laboratories, they have recently placed on the market some very important solvents of the cyclohexanol group, i.e., cyclohexanol pure, cyclohexanol

commercial, "Sextol," cyclohexanone, "Sextone," methyl cyclohexanone, "Sextone B," cyclohexanol acetate, "Sextate," cyclohexanol phthalate, ethyl oleate and diacetone alcohol. These new solvents and plasticisers are of the greatest importance, and have shown excellent results as solvents for incorporation in soaps for textile, laundry and dry-cleaning purposes, preparing drilling oils and emulsions for machinery and textile trades, polishes for wood, boots, metal, as a penetrating agent and "leveller" in dyeing, and solvents for fats, oils, resins, shellacs, celluloid, rubber, gums in the varnish, paint, enamel, rubber, artificial leather, waterproofing, etc., industries. In the manufacture of cellulose lacquers, Howards' Sextone and Sextone B are extremely valuable as solvents of nitrocellulose of the "medium-boiler" type, assisting the flow of lacquer and preventing "blushing." Frequently, when a new preparation is discovered showing any great improvement over old methods, the price is found to be a great difficulty, but in this instance the manufacturers claim that Sextone B is the cheapest "medium-boiling" solvent on the market. Lacquers containing Sextone can be brushed or sprayed on, and they give very hard coats on drying. There is a vast number of uses for these new solvents, and fresh fields are continually being explored.

Johnson & Sons, Ltd.

This firm makes assaying, mining and general chemicals, but it is perhaps best known to the general public as the source of the convenient packets of British-made photographic developers, such as Amidol-Johnsons, Metol-Johnsons, Hydrokinone, Pyrogallol-Johnsons, and Glycin. All these developers, which are made by the firm in large quantities in thoroughly up-to-date plant in an equally up-to-date works at Hendon, will be exhibited on Stand A. 27, in addition to the packets, solutions, Scaloids, etc. required by the amateur photographer. Other interesting exhibits to be seen on this stand are gold chloride and silver nitrate, as well as caustics, test books, and a range of pharmaceutical, general, technical and fine chemicals. The display will interest anyone who is interested in photography, either from a professional, process, medical or amateur viewpoint, but the consumer of chemicals for technical, laboratory or factory use will find not a little to interest him as well.

Malehurst Barytes Co., Ltd.

At Stand No. A. 35 will be displayed the firm's various grades of fine-ground barytes, which are entirely of British manufacture, the mineral being mined from the company's own mines at Minsterley, in Shropshire, and prepared in its own works. A great deal of up-to-date machinery has been installed to enable the barytes to be dealt with in a proper, scientific manner. Amongst other points in connexion with the firm's barytes, we may note that it is all air-leveigated. In addition to exhibits of various grades of barytes, there will be shown on the stand various instruments which are used in the examination and testing of the firm's products.

May & Baker, Ltd.

The products manufactured by this firm cover a very wide range, and on its stand (Nos. A. 9 and A. 11) will be

found both chemicals of interest to many branches of technical industry as well as some of the latest achievements in the application of chemistry to the cure of disease.

In the latter domain the firm has always held a prominent position in the manufacture of those arsenical products used in the treatment of syphilis and of tropical diseases. Arsenobillon (606), novarsenobillon (914) and arseno argenticum (silver-salvarsan) have all been manufactured by the firm since the earliest days of their introduction into therapeutics. To these products must now be added tryparsumide, an organic arsenic compound, the outcome of research in the Rockefeller Institute of New York, which is being successfully employed in the treatment of neuro-syphilis and sleeping sickness. The manufacture of this product is carried on in this country solely by this firm under licence from the Rockefeller Institute. Another product manufactured by this firm of the same category, which is finding increasing favour in the treatment of amoebic dysentery is Stovarsol (acetyloxyaminophenyl-arsinic acid).

The use of bismuth in the treatment of syphilis has proved to be of considerable value when used in conjunction with arsenic. One of the most useful of such products is Bistovol, the outcome of investigations carried out in the Pasteur Institute of Paris by Prof. Levaditi. This product is a combination of bismuth and stovarsol, and is now manufactured by this firm. Other interesting bismuth preparations are shown. Other products of therapeutic value are Mercurochrome, a mercury compound of fluorescein, a powerful antiseptic of low toxicity, and Mentarine, a new diuretic, which is a derivative of theobromine.

Hypnotics are important specialities of this firm. Butylethylmalonylurea is manufactured and supplied by them under the name of Soneryl, and has been largely adopted in medical practice. Other hypnotics and sedatives are phenobarbital and its sodium salt, which are manufactured and supplied by the firm under the trade name of Gardenal and Gardenal-sodium. The introduction of these products represents a great advance in the therapy of epilepsy, in the treatment of which Gardenal has been shown to be a highly effective palliative. As in the case of Soneryl, there is no tendency to habit formation with the use of gardenal.

In addition to the foregoing, the firm manufactures all the more generally-employed preparations of the various pharmacopœias. Foremost among such preparations may be mentioned the various salts of bismuth. Among anaesthetics, pure ether and chloroform are represented. Baker's anaesthetic ether answers the most stringent tests for purity, and the pure chloroform for anaesthesia is of equally high standard. Among other pharmacopœial products manufactured may be mentioned barium sulphate (for X-ray examinations), calomel and other mercurial preparations, camphor, bromides, iodine, and iodides, lithium salts, rochelle salt, seidlitz powder, etc.

On the more purely industrial side, first and foremost stand the mercurials. The firm is the largest manufacturer of mercurial salts in the Empire. Among these may be mentioned red and yellow oxides of mercury, used largely in the preparation of antifouling paints.

G. BELL & SONS, LTD.
Portugal Street, Kingsway, W.C.2.

As the result of considerable research, these compounds are now produced in the form of very finely-divided, voluminous powders, much more suitable for the purpose than previously was the case. Corrosive sublimate is manufactured on a very large scale, and finds employment in industry in many ways, such as the preservation of timber, disinfectants, etc.

Attention may also be drawn to the manufacture of solvents, *e.g.*, ether technical, all qualities, chloroform, amyl acetate, etc., to saponin, which finds employment in many directions, to diphenylguanidine, which is the standard accelerator in the rubber industry, to cyanides, molybdates, and many other similar products which find employment in all those industries in which chemistry bears a part.

Thomas Morson & Son, Ltd.

This exhibit (Stand A. 4) will consist chiefly of a demonstration of colloidal powders by means of special apparatus designed to show the very fine character of the individual particles of Osmo-Kaolin "Morson" and bismuth carbonate "Morson." Firstly by means of a "powder fountain" a fine spray of the material is thrown up inside a glass-sided case. The fountain is illuminated by powerful beams of light, and after a while the interior of the case is filled with a "powder fog."

The movement of the particles of colloidal powder is thus seen clearly, and the extremely fine condition of the powder may be readily appreciated. The extraordinary illumination effects as the fog of powder slowly clears are very striking, and the demonstration will provide an excellent example of the action of powder whose particles are in such a fine state of sub-division. Such finely divided matter possesses the property of increased physical and chemical activity, and therein lies the value of the medicinal action and applications in technical operations.

Aerosols, or finely divided matter dispersed in a gas, are closely similar to the corresponding hydrosols, or colloids formed as a result of the disperse systems of sols in water. In recent years it has been shown that the normal characteristics of a substance are profoundly altered when it is reduced to a finely divided state. This is due to the large specific surface which renders the substance more directly available for intimate activity. In the two products, Osmo-Kaolin and bismuth carbonate, forming the outstanding features of this exhibit, the above characteristics are ingeniously demonstrated.

Other products, such as iodides, glycerophosphates, Kreosote and scale preparations which have been manufactured by Thomas Morson & Son, Ltd., for many years, are also shown in addition to a number of chemicals used more particularly for technical purposes.

Salt Union, Ltd.

The exhibit (Stand No. A. 23) is designed to show the large number of products manufactured from natural brine by the Salt Union, Ltd. There is a model at the front of the stand of the Winsford Vacuum Works, where pure dried vacuum salt is manufactured under the most modern scientific conditions, the whole process being carried out in such a way that the salt is not touched by hand at any stage. At these works, also, a number of

well-known table salts are manufactured and packed under the most hygienic conditions. Amongst these may be mentioned Union Salt, Falk Salt, Falcon Salt, and the new iodised salt "Salodine," all of which are displayed in this exhibit.

Other products which are displayed and to which special attention is drawn are: A full range of the different grades of evaporated salt, from the coarse bay salt to the very fine dairy and table salt. "Tansel" is a specially prepared salt for curing hides. It effectively prevents the growth on the hide of those micro-organisms which have been shown to be the cause of salt stains. Owing to the careful grading of the crystals "Tansel" produces a maximum salting effect in a minimum time. Light carbonate of magnesia and calcium carbonate are by-products recovered in the special process of purification of brine for the production of pure salt. This calcium carbonate is particularly suited for stone-dusting in collieries, owing to its fine state of division and freedom from caustic alkalis. "Salunol" (hypochlorite of soda) is largely used in the bleaching of goods in the textile industry throughout the country, and is also a powerful disinfectant. Bleaching powder and caustic soda (solid and liquid) are produced by electrolysis of brine at the company's Weston Point works.

"Cut lumps" are made in handy sizes from the old-fashioned salt squares, and are carefully packed in such a way that they are received in a clean dry condition. Salt cubes are similar to the above, but of such a size that one cube is equal to a teaspoonful of salt. "Congo blocks" and "Dominoes" are used as currency by the natives on the West Coast of Africa, and therefore great care has to be exercised in their manufacture to ensure that they are of exact size and weight.

South Metropolitan Gas Co.

Visitors at the Fair will be pleased to feel an "Old World" atmosphere in stand arrangement in the Chemical Section. "At the Sign of the Benzene Ring" (Stand A. 15) is the replica of an ancient tavern, which presents some idea of the chemical operations of the South Metropolitan Gas Company, whose activities have extended throughout South London for over a century.

The tavern is constructed in an agreeable manner—so much so that it is hoped that enquirers will be drawn within its comfortable portals and rest awhile in cosy settles before a blazing log fire (a recent production of the company) and in these congenial surroundings a Metro representative will explain, if it be wished, how Metro creosote is used on the timberwork of the tavern, how Metro road tar has made the path smooth and firm to the door, how the crazy-paved courtyard is interestingly exemplified by the presence of Metro sulphate of ammonia in bulk.

As well as the prominent display of Metro disinfectant fluid, black varnish, motor benzol, etc., many samples of coal tar and ammonia products and inorganic products will be seen at the lattice windows of the inn, leaded windows in which is incorporated the symbolic "Benzene Ring" to emphasise to many industries the importance of benzene, naphthalene and anthracene—Metro manufactures.

Thomas Tyrer & Co., Ltd.

At Stand No. A. 25 some very interesting exhibits will be provided by Thomas Tyrer & Co., who will first of all delight the chemist by the show of sterling brand analytical reagents, and will then interest him by the display of manufacturing technique afforded by the exhibits of pharmaceutically pure bismuth carbonate in a wide range of densities. Fine plates of metallic bismuth showing interference colours will again lend themselves to trap the unwary visitor into thinking that they are coal-tar dyestuffs. Then there will be specialities such as the cobalt compounds used as driers for paints and the like; nickel salts (including nickel formate, previously only made in America, but now made by Thomas Tyrers in important quantities for use in hydrogenating oils) for use in the preparation of nickel catalysts; very pure chemicals for use in certain photographic processes, and various other chemical products of industrial importance. Of special interest are the scale preparations, including a series of double citrate, and there are the citrates of sodium and potash (such valuable aids in the feeding of infants), as well as a series of bismuth salts.

Whiffen & Sons, Ltd.

This exhibit (Stand No. A. 1) will consist of pharmaceutical and technical fine chemicals, manufactured at the company's Battersea and Fulham Works. The specimens are commercial samples and representative of bulk supplied in execution of orders. It is of interest to note that the firm, Whiffen & Sons, Ltd., comprises the original business of Thomas Whiffen, established in 1859 at Battersea, with which is incorporated the much older business of George Atkinson & Co., established as far back as 1654, and acquired by the late Thomas Whiffen in 1887. In the veterans' race for the oldest firm still in existence this claim to date back to the time of Cromwell surely entitles them to a place in the final heat. Prior to 1884, whilst manufacturing was permitted within the City boundaries, George Atkinson's factory stood at No. 66, Aldersgate Street, E.C. In 1884 it was removed to Southall, and remained there until 1923, when it was removed to the present modern riverside premises at Carnwath Road, Fulham, which still preserve the original title of "Aldersgate Chemical Works."

Among the items of outstanding interest are specimens of iodide and bromide preparations, present in comprehensive array and forming one of the staple products of the firm, in which they have specialised upwards of a century.

There will also be vermilion in all shades, pale orange to deep red. Some of the specimens have been exposed to light for more than fifty years without deterioration. Details of the firm's transactions in vermilion exist that date back two centuries. Among other distinctive specimens will be noticed:—Caffeine in masses of unbroken acicular crystals, unmatched for appearance and purity; and emetine and the principal salts, standard preparations for hypodermic administration.

There are also:—Quinine salts, complying with requirements of the various official standards; this special manufacture has been carried on at Battersea for upwards of 70 years. Nicotine for horticultural

purposes, manufactured under Customs' supervision since 1890, also nicotine pure for medicinal use, and salicylate and tartrate salts for treatment of skin disease. Strychnine and salts in bulk and in one ounce bottles under the brand "Jacob Hulle," by which it has been known for 75 years (Whiffen & Sons, Ltd., claim to be the oldest British manufacturers of strychnine). Salicin, the active principle of willow bark, discovered by Leront in 1830 and first manufactured by Thomas Whiffen in 1876. Camphor, resublimed from crude, in bells, tablets and flowers of bulky form and exceptionally white appearance. Other interesting specimens include atropine, pure and sulphate, hyoscyne and hyoscyamine, theobromine, prunella balls in new small sizes, samples of essential oils distilled at Fulham, and expressed oil of almonds answering all B.P. tests and extra pale in colour.

Williams (Hounslow), Ltd.

This firm (Stand No. A. 26) will be exhibiting a full range of their dyestuffs in crystals and powder, soluble in water, spirit, oil, wax, benzene, naphtha, etc., for application to leather, boot and floor polishes, soaps, inks (writing, ruling, endorsing and printing), wood, spirit, and oil varnishes, nitrocellulose lacquers, cotton, wool, silk, jute, hemp, coir yarn, cinematograph films, rubber buttons, horn, ivory, bath salts, raffia, lake-making, etc., and in addition to the dyes themselves they display various articles showing the application of the dyes. A special section will be devoted to harmless colours for foodstuffs etc., of which the firm are the leading specialists in the country. The firm are in a position to supply dyes in strict conformity with the laws of all the principal countries of the world. In addition, particular mention should be made of the firm's nigrosines and indulines, of which they are the oldest and largest makers in the United Kingdom.

IN OTHER SECTIONS**Ayrton Saunders & Co., Ltd.**

The exhibit on Stand No. A. 32 will be mainly pharmaceutical in character, and will include specimens of the Crookes' Collosols, as the firm is the export distributing agent for the products of the Crookes Laboratories. The Collosol products include colloidal preparations used by the medical profession, such as Collosol sulphur, iodine, aurum, argentum, selenium, kaolin, ferro-manganese, calcium, antimony, manganese, and palladium, as well as colloidal preparations of cod-liver oil, aluminium hydroxide, and so on.

Beetle Products Co., Ltd.

This firm, which is associated with British Cyanides, Ltd., is showing (Stand No. G. 21) its synthetic resin in various forms, as well as white moulding powders for electrical fittings and similar work, and coloured moulding powders with which translucent effects can be obtained.

Birkbys, Ltd.

The chief exhibit on this Stand No. J. 138 will be "Elo," a synthetic resin, for use in making mouldings, as insulating powder and for many other uses. This

Westminster, S.W.1.

CHEMICAL PLANT MANUFACTURERS,
NOTTINGHAM.

resin is very versatile, is chemically stable, resistant to temperatures up to 400° F., has no softening point, and possesses very good strength, both mechanical and electrical. Used as a moulding powder, considerable saving in manipulation is made, as the product is finished when it leaves the mould.

B. Black & Son.

Thermometers of an improved type are made by this London firm (Stand No. J. 205) to meet the requirements of industry or research laboratories for any range between -200° C. and +520° C. These precision thermometers have thermometric glass bulbs (N.P.L. standard blue stripe), are filled with nitrogen, and are claimed to be practically permanent, so that after long use the error, if any, is very small.

Blackie & Son, Ltd.

This well-known firm of publishers is to be housed at Stand No. L. 184, where its many books will be represented. Many well-known technical and scientific books have been published by this firm, such as, to mention a few, Dr. Cranston's "Structure of matter," Martin and Gamble's "Colour and methods of colour reproduction," "Photography as a scientific implement," Sexton and Davidson's "Fuel and refractory materials." These will be represented, as will be others of the "Applied Physics Series," mathematical books, dictionaries, and so on.

The Guelph Patent Cask Co., Ltd.

On Stand No. K. 65 will be found samples of the casks made at Millwall by the Guelph Patent Cask Company. The speciality to be shown this year for the first time is a cask with a paper bag lining. For many purposes this is in every way as effective as the "lined" style of cask, whilst it has the advantage of being considerably cheaper. The Guelph casks are made of birch grown in the company's forests in Canada, and are supplied in nine diameters, ranging from 10—22½ in., and in lengths from 10—34 in., increasing in quarter-inch stages. Thus it is possible to supply a cask which can be wholly filled, whereas a partly-filled cask will be subjected to risk of breakage from blows from its contents in the rough handling which is inevitable during transport. Four main types of cask are supplied: the "Plain" for ordinary dry goods or pasty materials like soap; "Iron-bound," preferred for the export trade on account of their strength; "Lined" with cardboard or paper, and used for dyes and chemicals, being tight enough to hold the finest powder; and "Tin-lined," used to convey liquids and goods which deteriorate on exposure to the air, being both waterproof and airproof.

Thomas Hedley & Co., Ltd.

As well as in the Chemical Section, soaps are also to be found in the main hall at Stand No. D. 56, where Messrs. Thomas Hedley & Co., Ltd., of Newcastle-on-Tyne, are showing Fairy olive oil soap, Fairy soap flakes, Dyso (ammonia wash powder), Fairy toilet, carbolic and other soaps, candles, "Glim" scouring powder, and the "Fleuroil" disinfectant spray.

James A. Jobling & Co., Ltd.

In another Section is the stand—No. G. 63—of James A. Jobling & Co., the manufacturers of the well-known Pyrex glass. Some fine products for domestic use will be on view, such as Pyrex transparent ovenware. Even the homely teapot has become magically transparent and translated in Pyrex. There will be a range of Pyrex heat-resisting glass globes for lighting purposes, and, of course, a comprehensive display of Pyrex laboratory glassware—beakers in all the necessary forms, as well as flasks, distilling flasks, moisture-test flasks, beaker flasks, evaporating dishes, test tubes, and a range of glass tubing in various thicknesses. Of interest is the Pyrex capillary tubing. It will be remembered that Pyrex is a low-expansion borosilicate glass of great stability, resistance to acids and alkalis, and hardness. The low coefficient of expansion makes it possible to produce Pyrex beakers and flasks with walls thicker than usual, which greatly increases the durability of the vessels without diminishing the resistance to sudden heating and cooling.

Ogilvy & Co.

This London firm of optical engineers is showing on Stand No. J. 203 an interesting selection of microscopical apparatus, amongst which we may mention a cheap, but well-made, microscope suitable for science classes. The exhibits also include a very neat micro-projection drawing apparatus which can be fitted to any standard microscope; a Brinell-Ogilvy microscope for measuring Brinell impressions or for use as a general workshop microscope; a variety of models of microscopical illuminating apparatus; and a very accurate Akehurst-Ogilvy substage mechanism, which can be adapted to any full-size microscope.

Stewarts & Lloyds, Ltd.

The exhibit of this Glasgow firm, which is to be found in another Section, is of considerable interest to chemical engineers, who can do little without piping. From the point of view of pipe work alone this exhibit will well repay attention.

Wilson, Warden & Co., Ltd.

Amongst an array of aneroid barometers and meteorological instruments on Stand No. J. 54 are some interesting barographs, thermographs and hygrographs, which are supplied, not only in the ordinary form, but also constructed with a solid white metal, which is non-corrodible, and is suitable for places where corrosion is likely or for humid climates.

Wray Optical Works, Ltd.

Stand No. J. 206 will be rich in photographic lenses, process lenses and prisms and so on, a specially interesting exhibit being the Kingslake Nephelometer, which is claimed to be the most accurate instrument yet designed for the measurement of the turbidity of liquids. Determinations of turbidity (opalescence) often form a convenient and sensitive method of quantitative analysis, and the instrument should be of interest to chemists. Sets of light filters will also be exhibited.

BUYERS BE WISE AND VISIT YOUR OWN TRADE EXHIBITION.

You will find examples of everything you require to carry on your business, including a special display of working machinery.

It is far better to see for yourselves than to order from Catalogues.

INTERNATIONAL OIL, CHEMICAL, AND COLOUR TRADES EXHIBITION

* From all accounts, it appears that the International Oil, Chemical and Colour Trades Exhibition, which will be held from June 11 to 18 at the Royal Agricultural Hall, in London, promises to be highly successful. The exhibition is the first of its kind in this country, and it is of a different nature from the usual type of exhibition. The industries which use and make chemical products are so wide spread and so intimately related with the chemical plant industry and the oil industry, that it became necessary to bring all these groups together to ensure a comprehensive display not confined to one or more sections of the industry. From the notes about the exhibits which we print below it will be seen that the different branches, both large and small, of the industry are very well represented. The time of year is propitious for an exhibition, the British makers of chemicals, colours and plant have many interesting products to show, and contrast is added by the presence of foreign manufacturers. Under such conditions an interesting and successful week seems certain. In the notes on the exhibits which we are able to print, thanks to the courtesy of the various exhibitors, the different firms are mentioned in alphabetical order.

Albro Fillers & Engineering Co., Ltd.

A range of vacuum-operated fillers will be shown. The single-head type is hand-operated, stands on a bench, and is suited for filling bottles with varnish stains, dyes and other liquids. Other types include the two-head, operated by a pedal; the automatic three-head, and the six-head fillers. Rotary types, either hand-fed or automatically operated, are supplied with from 6 to 16 heads, the output of the 16-head rotary machine being 80 bottles a minute. Other machines are an enclosed vacuum-operated powder filler for filling bottles, tins, jars, cartons, but not paper bags; various types of the firm's automatic trip-motion fillers for paint, varnish, oils, etc.; a lidding machine; and so on.

Morris Ashby, Ltd.

Samples will be shown representing the products of the largest zinc-oxide manufacturers in the world, including zinc oxide both in bulk and made up into paint, and painted panels. Demonstrations will be given of the methods for testing the fastness to light, and lithopone will be available in powder and paint form, as well as on painted panels. In addition to samples of vegetable and lamp blacks and gas carbon blacks, there will be specimens of Gilsonite—for which the firm is the sole agent in the United Kingdom—in its raw state. Gilsonite is used in the varnish trade and in making black and bituminous plant, and its various uses will be illustrated.

Attwood's Spraying Equipment, Ltd.

This exhibit will consist of all the firm's spraying units, including the following types: the "V" pistol, the "V.S." pistol with spreader nozzle, the "D" pistol, and the "A" and "B" air brushes. Various examples

of work done with this spraying equipment, which includes exhaust cabinets and fans and portable outfits, will be on view.

W. & T. Avery, Ltd.

This stand emphasises the fact that weighing machines used in industry need to be suited for their particular purpose; and in order to increase the economic value of the scales, they should give *visible* indications of weight, with the elimination of as many hand operations as possible. Most of the scales exhibited call for only *one* hand operation; the others, none at all. One scale, called No. A 557, "load and look" platform weigher, actually will not give a weight indication at all if the single hand operation—a much simplified movement—is not executed correctly. The scales of most interest to the trade, however, will probably be Nos. A 771 and No. 45. The first (A 771) can be set so that a run of containers can be filled to a pre-determined load in quick time, without fresh settings of the scales. The second (No. 41) is a fully automatic liquid weigher, which requires no attention during weighing operations. It is actuated by gravity, and total weights can be easily calculated from the indications of the automatic counter attachment. A similar type, No. 45, is suitable for dry, free-running granular material. Many other interesting machines are shown.

W. & S. Barron & Son, Ltd.

Three machines, in various sizes, are to be shown by this Gloucester firm. The first is the 36-in. size "Dreadnought" grinder, fitted with natural burr stones and designed to do all classes of fine grinding—colours, chemicals, oxides, etc.—usually done on flat grindstones. This grinder is claimed to possess all the advantages of the flat millstone as regards quality of work, whilst little floor space is occupied, and maintenance charges and stone dressing are reduced to a minimum. The second machine is the Barron impact grinder—really an improved form of disintegrator—which grinds and dresses in one operation. It grinds everything that a disintegrator can deal with, and to greater fineness, and it will reduce many substances which a disintegrator will not handle. The third machine will thoroughly sift and intimately blend a wide range of dry powders, such as self-raising flours, tooth powders, colours, tartaric acid, and so on.

Chas. H. Betts & Co., Ltd.

This firm will exhibit samples of bronze, aluminium and lustre powders, gold enamels, lacquers, leather stains, etc. Amongst the exhibits is "Bituminol" varnish, an elastic black coating for iron, steel, woodwork, corrugated sheets, etc., which resists acid fumes or sea water, and has high electrical insulation properties.

Blackstone & Co., Ltd.

The chief exhibit will be a Blackstone fuel oil engine, developing 55 b.h.p. at 240 rev. per min. This engine starts from cold on any grade of fuel oil that can be

Grinding Chemicals

WITH A MINIMUM

WITH
RAYMOND ROLLER MILLS

RAYMOND ROLLER MILLS have been used in Chemical Plants for the past 10 years and have been the means of greatly reducing operating costs and mechanical troubles.

The RAYMOND GRINDING UNIT gives dustless, clean operation, whilst no screen, makeshift air separator or elevators are required.

WRITE US FOR PARTICULARS OF THIS SYSTEM.

RAYMOND SYSTEM

pumped, the fuel being injected mechanically by a special "spring injection" device. The fuel consumption is very low, 0.4 lb. per b.h.p.-hr. for full and $\frac{3}{4}$ load in the single-cylinder types of 50 b.h.p. and over. There is also the Blackstone fuel oil heater and purifier, which both filters and heats the oil, and a combined petrol engine and compressor, for charging compressed air bottles.

S. Briggs & Co., Ltd.

Stainless steel, Corronil and Monel metal are amongst the metals in which this Burton-on-Trent firm specialises. On the stand will be found steam-jacketed pans in stainless steel, Corronil and Monel metals, as well as in aluminium and tinned copper. A well-finished copper still will occupy the central position, and varnish pans in varying sizes will also be shown.

E. A. Brough & Co.

On the stand of this Liverpool firm of iron and sheet metal workers and welders will be shown various classes of drums and tapers, including a number of drums subjected to severe tests made at the Liverpool University and by other independent authorities. Of special interest will be a demonstration of welding, showing particularly how the firm's "indestructible" steel necks are welded on to the drums.

'Buhler Brothers

Four machines will be shown on this stand. First comes a Buhler 4-roll grinding mill, which is distinguished by its three grinding passages. Some interesting features are to be noted in the construction of the mill, which is used for grinding pigments in turpentine, for paste or liquid paints and colours in spirit, as well as for printer's ink. A 3-roll mill is also shown, which is used when the large output of the 4-roll machine is not required. For dry colours, the hammer mill is shown, a type in which the sieves can be changed very quickly. The fourth machine is the "Detacheur," running at 2800 rev. per min., and used for grinding and sieving dry colours.

Building & Metal Export Co.

The exhibit will include red lead, white lead, orange lead, litharge (canary and half-flake), and acetate of lead, manufactured by the Società Lavorazione Metalli, Minerali e Derivati di Milan, a combine of Italian producers, for which the company is the sole agent.

Bush, Beach & Gent, Ltd.

Amongst the exhibits will be sal ammoniac, anhydrous ammonia (synthetic), calcium chloride, potassium hydroxide, carbonate, nitrate, and permanganate, barium carbonate and sodium nitrate, a variety of chemicals for the paint trade, and samples of "Carboraffin" and "Decolit" decolorising carbons. Associated with this stand is the exhibit of the London Fumigation Co., Ltd., which is showing "Zyklon B," the latest development in the use of hydrogen cyanide as a fumigator, and "Horo," for the extermination of rodent pests in the open.

J. Harrison Carter, Ltd.

A variety of interesting exhibits will be on view at this stand. In the electro-magnetic separator, which can also be used as an automatic feeder, separation is effected by

one or more pairs of electro-magnets mounted in a reciprocating tray, cut-out valves being provided to cut off the feed if the current fails. In the new model the dynamo used to excite the magnets will be driven from the crankshaft, thus rendering the machine independent of external supplies of electrical power. A mixer and kneader will be shown, suitable for moist and sticky materials, but also suitable for dry powders which are not too different in gravity. The machine is designed for a power drive, but hand-operated types are available. A mill is shown which grinds a wide variety of materials—colours, whiting, steamed, dried or green bones, paper pulp, bread, shellac, and many more. The hand-driven vertical end runner mill shown is useful for laboratory work, requiring the treatment of small amounts of colours. This mill can be cleaned very easily, and is available with pestle and mortar made of various materials. One size of grinding and kibbling mill is shown which is specially useful for breaking up lumpy materials in small quantities, but can be fitted with special plates for fine grinding. The firm's granite and iron edge runners will also be exhibited.

Cornbrook Chemical Co., Ltd.

This Stockport firm is showing a wide range of lake and fine pigment colours in lump form, together with examples of the finished articles coloured with these products. Paper dyed with Prussian blue, coated papers of various shades and qualities, linoleum, window blinds, paints and enamels, printing inks—these are some of the more striking forms in which colours will appeal to the eye.

John Dale Manufacturing Co.

On Stand No. 5 will be found a varied assortment of boxes and canisters made of tinplate, both plain and decorated, suitable for powders, pastes or liquids.

Aluminium containers are shown which are specially designed for the perfumery and allied trades. Collapsible tubes and perfume sprinklers are on view, and there is an interesting display of the stoppers with composition heads which are becoming so popular for bottled goods. The stoppers may be had with specially embossed designs, and in all colours.

J. Davies & Allen

Special lines of gold and silver paint, unmixed, known as "Glossolar" gold and silver enamel, as well as aluminium paint, bronze powder and aluminium powder in all shades and qualities, "Glossolar" art enamels and products such as stencils, brushes, etc. are shown.

Thos. Firth & Sons, Ltd.

A comprehensive range of manufactures made from Firth "Staybrite" and stainless steel is exhibited by this well-known Sheffield firm. "Staybrite" steel has a yield point of about 15 tons per sq. in. and an elongation of 55% to 70%, this exceptional ductility being combined with a remarkable resistance to corrosion. It may be cold-pressed to a degree far in advance of the so-called "stainless iron," and, moreover, it presents no difficulties in manipulation, since it can be welded, soldered, brazed and riveted without trouble. The exhibits will demonstrate the extraordinary resistance

TELEGRAPH WORKS CO., Ltd.,
Silvertown, London, E 16,
make these and can in all probability give you what you require,
whilst for **Copper, Brass or Cupra Nickel Tubes** you might
write to

Messrs. YORKSHIRE COPPER WORKS, Ltd.,
Leeds, Yorkshire.

Yours faithfully,

THE BRITISH CHEMICAL PLANT
MANUFACTURERS' ASSOCIATION.

British Plant for British Chemicals

of Firth "Staybrite" and stainless steels to the action of boiling acids such as nitric and nitro-sulphuric mixtures and many other chemicals, in addition to the corrosive action of paint. Numerous examples of chemical plant and apparatus made from these materials will be on view.

T. B. Ford, Ltd.

At Stands "C," Nos. 75 and 80, may be seen an excellent range of filter papers in sheets and circles of various sizes, and in white, grey and pink colours, also filter pulp with and without asbestos. The papers and pulp are of a high standard of quality, and have been produced after long and careful study of the particular requirements of the oil, chemical, and colour trades, of beer and vinegar brewers, wine and spirit bottlers, maltsters, sugar refiners, and so on, and have proved after long usage to give excellent results in filtration. For analytical, quantitative, qualitative and pharmaceutical purposes in laboratories and schools, this firm provides three high-grade filter papers of a very low ash weight and a perfect level sheet of equal filtering power all over.

Joseph Foster & Sons

This exhibit consists of motor-driven mixers suitable for mixing or diluting paints, enamels, inks, pastes, patent foods and so on. Three types will be shown, the type "A" vertical mixer being provided with two sets of stirrers, which revolve in opposite directions: the capacity is 25 galls. Type "B" vertical mixer, of 20 galls. capacity, has also two sets of stirrers, which revolve on their own axes and rotate round the centre of the pan; both types possess means for lifting the stirrers out of the pan. A horizontal mixer is shown, in which the two sets of stirrers revolve in the same direction; this machine has a working capacity of 16 galls.

Fullers' Earth Union, Ltd.

Fullers' earth is a material which has been used for many centuries, but this exhibit may cause some surprise to those who are not aware of the many grades which this company prepares from material mined in its quarries and mines in Surrey and Somerset. The material is shown in its natural state as well as in a variety of final products as used for various purposes. A selection of coloured earths illustrates the capacity which fullers' earth possesses for absorbing and carrying colours, whilst its use for refining and bleaching oils is shown by samples of oils such as palm kernel, rape, cottonseed, nut, soya and so on, both raw and after treatment. A pure colloidal clay made by the electro-osmosis process will be exhibited, the extreme fineness of the material which remains suspended in air like fog being demonstrated by means of powder-spray fountains. A series of microscope slides enables the visitor to study the physical nature of this clay and of fullers' earth, whilst a sectional scale model of the company's mines in Somerset depicts the origin of the material.

Wm. Gardner & Sons (Gloucester), Ltd.

A large exhibit of the latest productions of this firm will illustrate the wide variety of machines made for grinding, sifting, blending and drying powders. There

will be the Gardner "Rapid" sifter and mixer for all dry powders, "Rapid" dryers for rapidly removing moisture from powders, the "Rapid" sifter, mixer, and essence spray for adding liquids, essences and so on to powders during mixing, and machinery for spraying and adding moisture to powders. Amongst the mills are ball mills with various types of lining, and roller grinding mills, and there are the "Quick-Change" dressing machines, with removable barrels to sift coarse or finest grades, the "Rapid" grinder and sifter for grinding and sifting in one operation, a diaphragmic feeder for adding colours, improvers, etc. to bulk material, an agitator mixer, a machine for shredding and granulating wax—and more beside.

The Building Trades Practical Laboratory

This Grimsby firm (proprietors, The Graphite Oils Co., Ltd.) is showing almost exclusively a series of bitumen compound waterproofing materials for application in plastic or semi-liquid consistency. The centre of attraction is a small building erected with common bricks and roofed partly with old slates, partly with porous tiles and some asbestos cement tiles. The walls and roof have been treated in patches with "Protion," which is a red bitumen compound having a finishing colour similar to pressed bricks of deep tone. The makers state that in the process of rendering a wall or roof waterproof the property is simultaneously given a pleasing appearance. "Slatex" semi-liquid bituminous waterproofer for slate roofs is also exhibited. This is slate grey in colour, whilst "Rufoid," an easy working plastic for flat roof insulation and general maintenance work, is also shown with examples of uses in waterworks, lining tanks and so on.

Harts Colours, Ltd.

A wide range of dry and pulp colours for the paint, printing ink, linoleum, paper coating, wall-paper and allied trades is shown, together with examples of the finished products. In each case the specimens of paint and so on are accompanied by samples of the particular colour or colours which have been used.

Harry Heymann, Ltd.

The speciality on this stand will be the "Monopol" and "Culminex" self-priming syphons, which are made in a variety of sizes so that any kind of vessel can be emptied without loss by splashing or spilling. The syphons, which are made in various materials to withstand corrosive liquids, are automatically self-primed, and the flow can be regulated at will. A syphon lift is shown which indicates when the filling of a vessel is complete.

Leonard Hill, Ltd.

At this stand can be seen copies of the "Chemical Engineering and Chemical Catalogue," which includes a large directory of manufacturers of chemicals and plant, an index of trade names, a guide to the uses of products and plant in about one hundred different industries, a selection of data of interest to chemical engineers, industrial chemists and works managers, and a list of many important technical books. In addition, the firm will show its new publication, "Food Manufacture,"

FORD'S "428 MILL" FILTER PAPERS

By the Makers of the well-known Blotting Paper.

For Both
ANALYTICAL
and
INDUSTRIAL
Use.

A COMPLETE RANGE OF ALL FILTER PAPERS FROM THE HIGHEST GRADE FOR ANALYTICAL work to those suitable for all Industrial Purposes. Most chemists consider the uses of Filter Paper only for laboratory purposes. Many manufacturers, however, are now using Ford's Filter Paper—specially made for the purpose—on an industrial scale in their filter presses, either with or without filter cloths. More rapid filtration, brighter filtrates, less time and labour in clearing and cleaning the presses, and less wear of the filter cloths (if also used) result.

Try them in your presses—at our expense.

T. B. FORD, LTD.,

THE INTERNATIONAL OIL, CHEMICAL and
COLOUR TRADES EXHIBITION.

Fire!

Are your Premises PROPERLY PROTECTED?

We are exhibiting at the Oil, Chemical and Colour Trades Exhibition.
June 11-18.

2 gallon size.
Ref. No. E269

There is only one efficient method of covering the grave risk of FIRE where stocks of OIL, SPIRITS, VARNISHES or CHEMICALS are involved! INSTAL VALOR FOAMERA EXTINGUISHERS without delay! Of the turnover type, they are instantaneous in ACTION, and are made in 1, 2, 3 gallon sizes; also in a special 1 gallon pattern for use on vehicles.

For large works we can supply 20, 30 and 40 Imperial gallon VALOR FOAMERA ENGINES for indoor or outdoor use. As demonstrated at the Professional Fire Chiefs Conference at Perth. We have been favoured with repeat orders from the Air Ministry for this type of machine.

We are also makers of the well-known FYDRANT, NEWERA and FYROUT SODA and ACID MACHINES for ordinary risks, and The VALOR C.T.C. type for use on cars and in Electrical Establishments.

All our extinguishers are made to the SPECIFICATION of and APPROVED by the FIRE OFFICES COMMITTEE.

Write to-day for List 50V5 giving all particulars of the above, also list of satisfied users. Installed all over the World.

TRADE MARK.

When writing to Advertisers, please mention "Chemistry and Industry."

and will give some idea of the service rendered by its technical and engineering studio.

Bernard Holland & Co.

This firm will show a rotary air compressor or vacuum pump, driven by a 3-phase slip ring induction motor. When used as an air compressor, the machine will deliver 800 cb. ft. of free air per minute at pressures up to 60 lb. per sq. in., and when used as a vacuum pump is suitable for maintaining a vacuum up to 95% of the barometric scale. This machine, which is widely used for handling corrosive gases, is available in twenty-one sizes, with outputs ranging from 14.6 to 4000 cb. ft. per minute, and can also be supplied as two-stage machines. The machine is cooled by water, but an air-cooled machine is also on view. Another exhibit is a small, self-contained, rotary air compressor or vacuum pump, which is fitted to transport lorries for handling sulphuric acid and so on. Examples of the Deville petrol, paraffin or gas engine are also exhibited.

Horton Manufacturing Company, Ltd.

The speciality of this firm is the production of liquid toilet soaps which contain no coconut oil. Samples of these soaps in qualities for factory, mechanics' and domestic use, will be on view, as well as a series of lubricating greases which are supplied only to trade users, specimens of Horton jelly cleanser, and other products.

Howards & Sons, Ltd.

Howards & Sons, Ltd., of Ilford, are exhibiting an interesting range of solvents, chiefly of the cyclohexanol type. Sextone, Sextone B, and diacetone alcohol are medium-boiling solvents for the cellulose lacquer trade; Sextate is a high-boiling solvent, and isopropyl acetate a low-boiling solvent for the same purpose. These solvents are also used in a variety of other trades. Sextone and Sextone B, in addition to their powerful solvent action on nitrocellulose and gums, their properties of assisting the flow of the lacquer, imparting a glossy, smooth, even surface, and preventing "blushing," and their suitability for incorporation in brushing lacquers, have remarkably high dilution ratios with respect to toluene, 7.25 and 5.5 respectively. Sextone, Sextone B and diacetone alcohol are excellent paint and varnish removers. Two plasticisers are also exhibited, cyclohexanol phthalate and oxalate. Sextol finds its chief application as a detergent which is incorporated in soaps for the woollen, cotton, linen, silk, artificial silk, laundry, dry-cleaning and dyeing trades. Cyclohexanol pure is used for the same purposes, but its use is preferable to that of Sextol for dry cleaning. "Vulpex" soap, also shown, is a liquid Sextol soap for use in the textile industry, particularly the woollen industry. Other uses of Sextol are in the preparation of water-soluble solvent and emulsifying agents for fats and oils, and in boot, metal and wood polishes; as a constituent in paint and varnish-removing compositions.

International Combustion, Ltd.

At this stand the chief exhibit, provided by the Grinding and Pulverising Department of International Combustion, Ltd., consists of a working model of the Raymond roller mill. In this machine the material is ground between rollers and a bull-ring, direct contact

of metal to metal being avoided by the provision of ploughs which throw the material up in front of each roller, so that wear is reduced to a minimum. The semi-ground material is lifted by means of a fan to the separator, in which it is graded. The fines then pass to a cyclone and oversize material or tailings fall by gravity back into the mill for retreatment. Pulverising, elevating and conveying are thus carried out in one operation. Photographs are shown of other products of International Combustion, Ltd., including the Hardinge conical ball and pebble mills and Hardinge air classifiers, whilst information relating to the Gayco centrifugal separators, Raymond air separators, Raymond pulverisers, and Hum-mer electric screens, will also be available for enquirers.

G. T. Johnson, & Co.

The principal feature of this stand will consist of samples of a very wide range of steel containers, drums and kegs particularly suitable for oils, paints, colours and chemical goods. Alternative lids and closing processes will be demonstrated.

H. Keller & Co.

As the London agent for J. M. Lehmann of Dresden, this firm is showing Lehmann paint and colour-grinding mills of various sizes, with truly cylindrical rolls of chilled iron or fine-grained porphyry, mounted on ample bronze bearings provided with efficient ring lubrication. A colour-mixing machine, built on the planet system, and a hopper paint mill are also on view.

Langley-Smith & Co., Ltd.

American turpentine, raw, boiled and refined linseed oils, all grades of general lubricating and motor oils, tallow, and American, French, Spanish and Portuguese resin will be amongst the exhibits. The firm is the sole distributor in the United Kingdom of the naval stores of the Hercules Powder Co., which will exhibit wood turpentine, wood rosin, "Solvenol" pine oils, lacquers, etc., the various stages of production being illustrated.

Marchant Bros., Ltd.

Grinding, mixing and straining machines for the printing-ink, paint, pigment and similar industries are shown on this stand. There is a five chilled iron roller grinding mill, with a pair of overhead horizontal mixers, a combination which economises floor space and enables large quantities of material to be dealt with. A micrometer gear is provided for the adjustment of the rollers. Other machines include a triple chilled iron roller grinding mill fitted with a small horizontal pug over the rollers suitable for sample work, etc.; rapid double and single cone mixers with portable pans; a 10-gall. single cone mixer; and a paint and enamel straining machine. The 5-roller grinding mill and overhead mixer will be running throughout the day.

Masson Seeley & Co., Ltd.

This firm is showing the Masseley machines, which enable the user to produce showcards with an untrained staff. A range of models is displayed, and materials to meet every requirement are available. Demonstrations will be given of the machines.

Mastabar Belt Fastener Co.

The exhibit consists of a display illustrating the advantage of the "Mastabar" belt fastener, a simple and efficient device for joining transmission belts. A special tool is made which fits every size of fastener, so that any belt can be quickly and neatly joined.

National Time Recorder Co., Ltd.

This firm is showing a series of its time recorders, which are made in London. Various types are available, including a portable autograph recorder for office use, a time stamp and various other "National" machines.

W. T. Nicholson & Clipper, Ltd.

Amongst the exhibits on this stand are the improved "Klincha" belt lacing machine, tools for use in connexion with belting, the "Klincha" belt cutter and belt-cutting shears, and a new type of belt cutter with a circular knife.

Reckitt & Sons, Ltd.

Here is a comprehensive display of the many shades and qualities of ultramarine supplied by this well-known Hull firm, which has one of the largest plants for the manufacture of ultramarine. The exhibits include: alum-resisting ultramarines for paper manufacture, desulphurised ultramarine for printing inks, desulphurised and alum-resisting ultramarines for use in the manufacture of rubber articles, and ultramarines for coach painting. There is also an interesting exhibit of various manufactured goods in which ultramarines produced by this firm have been used.

W. Rowlandson & Co.

Two types of "Autosell" mixer are shown, the 10 gall. type being fitted with a steel pan and stirrers, and the 2½-gall. type with a "Staybrite" stainless steel pan and stirrers; capacities up to 20 gall. are available. In this machine the pan revolves and the contents react on the stirrer blades, the free revolving head being, like the pan, mounted on ball bearings. The 50-gall. "Rowlandson" mixer on view is steam-jacketed and fitted with tipping gear; this machine is used for blending materials such as meals, paints, soaps, powders, liquids, cellulose varnish, rubber solutions, etc. The 20-gall. "Unique" mixer, fitted with "Staybrite" steel stirrers (not steam jacketed) is used for ointments, face creams, polishes, pastes and preparations in which liquid pastes or powders are blended and cooled to prevent settling. There is also a 5-cwt. "Geyser" mixer, made in capacities up to 40 cwt., and suitable for all dry materials, and a 150 lb. combined sifter and mixer, which can be had in capacities from 50 lb. to 1 ton.

Sachtleben A. G.

Three qualities of blanc fixe are shown by this Cologne firm, ordinary bright for paint and paper, and photographic matte for photographic papers. Various qualities of lithopone are shown, whilst "Sachtloith" is a pure zinc sulphide pigment of unusual opacity and whiteness, which is made by a new process, and should interest manufacturers of cellulose paint.

Sandeman Brothers

The exhibit comprises "Saroni" cleanser, which is a very effective and simple means for cleansing greasy and oily hands, a series of rosin oils, ranging from grease-making oil to refined pale straw oils, as well as rosin spirit; and a display of the firm's greases and lubricants for various purposes.

Sidney Smith & Blyth, Ltd.

A wide range of machinery for mixing, grinding and finishing paints, inks, drugs, etc. is made by this firm, and all its specialities will be on view, most of them being in motion with the actual paint, enamel, etc. being manufactured. There will be four models of the single roller mill, two of the two-roller mill, two of the triple-roller mill, a large combined plant comprising one 30-in. twin horizontal mixer mounted over a 15-in. by 30-in. and 12-in. by 24-in. tandem two-roller mill. A comprehensive range of pug mixers from 18-in. single up to 30-in. twin, will also be on show, together with whirlpool mixers, edgerunner mills, and laboratory plant. A new two-roller mill which has very special features will be on view for the first time.

J. W. & T. A. Smith, Ltd.

This firm makes pulp and dry colours, as well as fine lithographic colours, and advantage has been taken of its resources in colour to display them in glass containers in such a way as to make the stand, which takes the form of a lounge, very attractive and accessible.

Steele & Cowlshaw

Pulverisers are the main feature of this exhibit, the firm's speciality being pulverising cylinders. These are not intended for continuous grinding, but for grinding material in batches. They are charged and discharged according to the class of material to be ground, and the time required to obtain the necessary degree of fineness. Flint pebbles, or porcelain or iron balls are used as grinding medium, the cylinders being usually lined with silex, porcelain, or hard-cast-iron, though special linings can be supplied for particular requirements. Either wet or dry grinding can be used. The machines are also efficient mixers.

Stevens & Manning

The stand will display sieves for every chemical purpose and wire gauzes in steel, iron, tinned steel, galvanised iron, brass, copper, phosphorbronze and Monel metal up to 275 mesh. In addition to silks and other screening material, there will be a "Moto-vibro" screening plant on the Sturtevant system, and paint strainers, steel wool and barrels.

Colin Stewart, Ltd.

An array of fine white silicas is displayed on this stand. The raw materials shown are: (1) crystalline silica or quartz; and (2) amorphous silica. From the latter are prepared the various grades of fine silica sold under the name of "Milowite." This product tests over 98% SiO₂, and owing to its remarkable texture and fineness it finds considerable favour in the paint, colour, chemical and rubber industries. Milowite, despite its softness,

retains abrasive quality, and is suitable for use in metal polish. For uses in which colour and fineness are not of prime importance, "Rostellan" silica is available. Samples of crushed and graded Manx spar, for filtering purposes, building work, etc., of "Albionite," a coloured wood filler, and of "Silicanite," a preparation for castings which expands on heating, are also to be seen.

Strontium Products, Ltd.

In Gloucestershire, where this firm has its works, very pure celestine is found, consequently the actual content of strontium sulphate is rarely below 96%, whilst the product has the advantage of freedom from lime or alkali. As a pigment or extender, strontium sulphate is very similar to barytes. It has a uniform oil absorption equal to that of the best grades of barytes and less than that of cheaper qualities; owing to its slightly lower refractive index, it does not tend to reduce the brightness of the colour with which it is mixed so much, and as its specific gravity is slightly lower the suspension in oil is claimed to be better. Material of uniform standard fineness is available and still finer grades are produced.

Tangyes, Ltd.

Dominating this stand are a 47 b.h.p. heavy oil engine and a 20 b.h.p. fuel oil engine, both of the cold-starting type. The heavy oil engines can be arranged to use tar oils, alcohol, etc., or to use either liquid or gaseous fuels, and are remarkably efficient and economical. Some interesting pumps are shown, including two 6-in. "Tan-Gyro" centrifugal pumps for various heads, a 4 x 6 in. vertical treble ram pump, a 6-stage turbine pump, and a complete range of vertical single ram pumps. A 40-ton hydraulic press and a selection of pulley blocks, lifting jacks, etc. complete the exhibit.

Thomas & Bishop, Ltd.

The chief exhibits are: a demonstration of the advantages of treating belts with "Cling-Surface"; a demonstration of the value of "Permac" as a cheap but efficient jointing material; a working model showing various types of lubricators using "Flexo" grease, supplied in nine densities; a sample of "Flexo" leather and textile belting; and a series of refractory cements, for bonding and protecting fireclay, the uses being illustrated by sample briquettes with "Flexo" joints in fireclay, silica, chrome, bauxite, and magnesia bricks.

Torrance & Sons, Ltd.

Paint-making machinery on this stand includes mills, mixers and pumps. Amongst the mills is the Torrance "Silent Quadrant" triple roller mill, with a micrometer adjustment which enables the rolls to be set at any desired clearance, say one 2000th of an inch. The paint is subjected to an increased grinding pressure, although the rolls do not meet. Other features in this machine are the patent lateral gear, the new scraper knife and an improved type of belt guide. Various sizes of the Torrance Silent Quadrant Mill are shown in addition to examples of the "Micro twin" mill, the "Vortex," "Perfect" and "Little Giant" mixers, and various paint and varnish pumps.

* Thomas Tyrer & Co., Ltd.

"Stirling" chemicals which will be in evidence are products for anti-fouling preparations, colouring glass, and vulcanising rubber; thickeners for lubricating oil and for paint and varnish media, and chemicals, including cobalt salts, for driers. Salts for the preparation of catalysts for hardening oils will be shown, and there will be mordants and other products bearing the familiar "Stirling" brand.

Utrechtsche Machinefabriek

The exhibits of this firm comprise:—an oil-exPELLER, which is an automatic machine for the expulsion of oil from oilseeds and other oil-containing materials; a crusher, made for crushing cattle cake, but also used for breaking salt and ores which are not too hard, and a model of a "Frasmu Battery," a heavy hydraulic plant used for expressing oils.

The Valor Co., Ltd.

Amongst the exhibits on this stand are "Valor" oil cabinets for storing lubricating, light and other oils, hand pumps, and drums for oils, oil filters, transport cans, and a "Valor" waste settling tank. The "Valor" fire extinguishers include various types of soda and acid machines for ordinary use, the "Valor Foamera" extinguisher for oils and inflammable liquids, and the "Valor C.T.C." for motor vehicles, inflammable liquids and electrical fires. In addition, there will be one of the latest 30-gallon "Valor Foamera" extinguishers mounted on wheels, this being the type which is used in oil, paint and other factories.

D. Waldie & Co., Ltd.

The exhibit of this firm consists of samples of turpentine and rosin manufactured by the Indian Turpentine & Rosin Co., Ltd., of Bareilly, India.

Whiffen & Sons, Ltd.

Prominent amongst the exhibits are the specimens of genuine quicksilver vermilion in various shades. The vermilion is made in all shades ranging from pale orange to deep red, and any tint can be matched no matter how delicate. The product is entirely stable, and specimens are shown which have been exposed to light for more than fifty years. They are as bright and good as when first manufactured. A specimen of pure sublimed cinnabar is shown alongside the samples of vermilion. In addition, there is an interesting range of various articles exhibited in which vermilion has been employed, as well as some fine specimens of highly finished paint work, all serving to demonstrate the wide use of this chemical colour, and its superiority above all substitutes where a striking and permanently brilliant red colour is required.

Society of Chemical Industry

Stand No. 51 is that occupied by the Society of Chemical Industry, and here enquiries about the work of the Society or about its publications will be welcomed. Specimens of the publications of the Society will be displayed, and the representatives who will be in attendance will be glad to give any assistance to visitors which is in their power.

TRADE NOTES

In connexion with the special Annual Meeting number several firms have sent us interesting notes about their activities. An account of these communications is given below, the various firms being dealt with in alphabetical order.

Blair, Campbell & McLean, Ltd.

An interesting speciality of this firm is the plant required for the manufacture of cellulose acetate. The firm has made plant for this purpose for a number of years, and has supplied it to many firms in this country and abroad. An important part of a cellulose acetate plant is the kneading and mixing machine, that made by the firm is of special design, and is to be found in practically every works manufacturing cellulose acetate both in this country and on the Continent. The machine produces a very thorough and intimate mixture, and can be regulated very exactly in working. Amongst other plant used in connexion with the manufacture of artificial silk, the firm also manufactures plant for the production of sodium acetate, acetic acid, and acetic anhydride, another speciality being plant for the recovery of acetone. It is worthy of note that cellulose acetate plant is being manufactured on such a large scale in this industry, as it is thought erroneously—that most artificial silk plant is obtained from the Continent.

Borax Consolidated, Ltd.

No one can escape the blandishments of the "Twenty Mule Team" brands of borax and boric acid, which are obtained by Borax Consolidated, Ltd., from North and South America and Asia Minor in the form of crude boron minerals and refined at Kidsgrove, Staffordshire, and Belyedere, Kent. From the permanent wave of the hairdresser, the rotundity of the felt hat, distempered walls, to soap and fire-proofed fabrics, the ordinary citizen cannot escape borax, and the manufacturer requires it and boric acid for use in working, refining, and smelting metals, to produce enamels, to glaze pottery, and to make glasses of low thermal expansion and maximum durability. In addition to its use in the glass industry, borax is equally important in the manufacture of leather, whilst it is a valuable detergent for textiles, and with boric acid finds many pharmaceutical uses.

Brinjes & Goodwin, Ltd.

This Cold Harbour firm reports it is exceedingly busy, as its "Helix" patent triple roller-mill continues in increasing demand. In addition to quite a number of repeat orders from Great Britain, the firm has in hand a repeat order for New Zealand for a duplicate combined plant to one supplied last year, and it is removing Messrs. Lorilleux & Bolton's Printing Ink Factory to large new works at Tottenham and supplying a number of new "Helix" mills in connexion therewith. A second repeat order has been received for mills for B. Winstone & Sons, Ltd., of Shoe Lane, London, E.C., and Stratford, and a further order for mills for the new factory of A. B. Fleming & Co., Ltd., of Edinburgh.

W. J. Bush & Co., Ltd.

Founded in 1851 by the late Mr. W. J. Bush, this business was the first established in England solely for the manufacture of flavouring essences, of which artificial flavours soon became a prominent feature. Later on the distillation of essential oils was undertaken. The business has shown a steady growth, and branches and subsidiary companies were established in several foreign countries, the principal of which are situated in Melbourne, New York and Montreal, and formerly in Moscow. With the advent of synthetic perfumes and flavours the company turned its attention to the manufacture of these products, and was the first to manufacture in England on a commercial scale salicylic acid, vanillin, coumarin, terpineol, and numerous other articles in this field. During the War a considerable demand was made on the company, and the manufacture of a great variety of chemicals was undertaken, many of which have since had to be abandoned for economic reasons, but a new department of the business was created to which a great deal of attention is still being devoted. The company now specialises in solvents and plasticisers for the lacquer industry and a number of intermediates for the coal-tar industry. These developments have necessitated large extensions, not only of the original Ash Grove factory, but the construction of new factories at Widnes, Lancashire, for the heavier chemicals, and also at Mitcham for certain specialities.

Car Owners Mutual Assurance Society, Ltd.

In these days of intense motor traffic there can be but few car owners who are so unwise as to neglect the protection afforded by insurance. It is of interest to note that membership of the Car Owners Mutual Assurance Society, Ltd., converts insurance into a profitable investment, as the Society is conducted on co-operative principles, and the profits—calculated at 10% of the annual premium with any selected insurance company—belong to the members. As the total cost of membership is one guinea only, many car owners will welcome such an opportunity of "getting something back."

T. & C. Clark & Co., Ltd.

Acid-resisting enamelled cast-iron chemical plant is the speciality of this firm, which is one of the oldest firms of its class in the country, as it was the original patentee in 1839 of a lead-free enamel for cast iron. Amongst the cast-iron plant lined with acid-resisting lead-free enamel made to meet the requirements of the chemical and allied trades are jacketed pans, stills, mixers with capacities ranging from 5 to 300 gals., furnace pans, granulators, tanks and cisterns, and an extensive range of small enamelled vessels for use in the manufacture of pharmaceutical products, in laboratories, and for research work. The firm is ready to supply to specification or submit designs to meet particular needs.

Evans, Adlard & Co., Ltd.

Filtering paper is one of the oldest specialities of this firm, which was one of the first British makers to produce

this article. "Postlip" filter papers are produced in a large variety of grades, which practically cover all the requirements of the laboratory (where unwashed papers can be used) and of modern industry. Steadily expanding trade at home and abroad shows that the quality of "Postlip" filter papers is appreciated.

The Gotham Co., Ltd.

The attention of chemists connected with the gas industry is now being directed to gypsum and anhydrite, because they are the cheapest available sources of the sulphate radical. Anhydrite from the mines of the Gotham Co., Ltd., has already been supplied in large quantities for use in the manufacture of sulphate of ammonia by the interaction of carbon dioxide, ammonia, and calcium sulphate. Bearing in mind the present unsatisfactory return from the manufacture of sulphate of ammonia, by the use of sulphuric acid at gas works, it is very likely that gypsum or anhydrite will be brought generally into use as in the case of the sulphate now being produced from synthetic ammonia. The Gotham Co., Ltd., of Nottingham, is one of the largest gypsum producers in this country, and it operates gypsum mines and mills in the counties of Nottinghamshire, Derbyshire, Cumberland, and Westmorland. It is the proprietor of many well-known brands of plaster, gypsum cements, and hard wall plaster, and also manufactures pink meal for cleaning tinplate, and pixie powder, a gypsum stone dust for colliery use.

Robert Jenkins & Co., Ltd.

This firm was established in 1856, and is believed to be the largest manufacturer of welded steel tanks etc. in the British Isles, having a capacity of over 300 tons a month. The firm's products include a wide range of wrought steel, welded boilers of every kind for heating by low pressure hot water and for domestic hot water supply, as well as welded cylinders, annealing and hardening pots, copper boilers and cylinders, steam boilers, and storage tanks for oil, water, petrol, and so on.

Lennox Foundry Co., Ltd.

Tantiron—the first acid-resisting iron to be put on the market—has been made and supplied for the last 18 years by the Lennox Foundry Co., which can thus claim to be the original makers of acid-resisting alloys. The firm also makes the acid-resisting alloys, Tantocopper, Tantnickel, and so on, and chemical plant in all other metals. The factory at New Cross is large and well-equipped, and includes a very up-to-date chemical department for analyses and research. The products of the firm appear to comprise plant for nearly all chemical processes, including plant for the synthetic production of most organic bodies.

Thomas Locker & Co., Ltd.

The first man to weave wire by steam power in England was Mr. Thomas Locker, who founded the firm which bears his name in 1879. A large output is maintained at the firm's Ellesmere wire works, almost entirely confined to wire cloth and metal perforations for use

in rice, flour and cement mills, in gold-mining and in chemical works. The attention which this firm pays to the quality, durability and reliability of its products is well known, and it is interesting to note that an additional line of manufacture—brushes for mill and foundry work—has met with equal appreciation from users.

George Scott & Son (London), Ltd.

Such a wide range of chemical plant is made by this firm that adequate notice is impossible within the space available. Complete plants are supplied for the oil and fat industries, for animal by-product manufactures (glue etc.), for solvent recovery, for making paper, lactose, milk powder, malt extract, caustic soda and so on, whilst the specialities include vacuum evaporating plant for all trade liquors, used in many industries, amongst which the paper industry stands prominent, and practically every known type of dryer, including the successful dryer used in the De Vecchis process for drying sugar beet, which was improved by the firm and installed in Italy in competition with the chief European firms. The firm is associated with Ernest Scott & Co., Ltd., both firms being under one control.

F. Weinreb

This firm manufactures K.K.K. homogeneous lead, tin and nickel-lined material. The disadvantages of loose lead lining are that the lead sheets first begin to show creases, and folds, or blisters, then sagging sets in, and finally they fracture or tear. Loose lead lining is a constant overhead charge. Homogeneous means sameness of structure, and the word homogeneous can be with justice applied to the K.K.K. lead lining as the lead does not separate from the steel or copper even at the highest vacuum, and can only be removed by mechanical force. The initial cost is, of course, higher than that of loose lead lining, but, if properly inspected during the first few weeks after installation, K.K.K. homogenous lead lining lasts for 10, 12, or even 16 years. It is claimed that nearly all artificial silk manufacturers in the world use either K.K.K. lead or tin-lined plant. For chemical reactions which have to take place in nickel or silver the firm supplies homogeneous nickel or silver-lined plant which, if designed for higher internal pressures, are cheaper than vessels made entirely of these expensive metals. Turbo blowers and compressors are another speciality, manufactured since 1910. The firm has supplied SO₂ blowers for the majority of Tentelew plants in the world, some of which have been running for 16 years without requiring any repairs. The firm has devoted also considerable attention to the problem of mixing, stirring and emulsifying, and developed the torpedo-stirrer which sucks in the various constituents at the bottom of the vessel and throws them out in the middle, or top of the contents. This stirrer, which is claimed to be more efficient than any other existing type, did not, however, solve all mixing problems, and led to the development of a new form of emulsifier which is being built at the present time in sizes up to 3,000 gals./hour capacity (measured by its capacity as water pump).

Dyeing of textile fabrics (R. S. Horsfall and L. G. Laurie). J. E. G. Harris	1187
Enamels; Pyroxylin — and lacquers (S. P. Wilson)	584
Enzyme; Lehrbuch der — (C. Oppenheimer). A. R. Ling	409, 448
Enzymes: Properties, distribution, methods and applications (S. A. Wakeman and W. C. Davison). F. W. Norris	1187
Erlen, Selenen; Die — vom Standpunkte des atombaues (Dr. G. von Hevesy, edited by M. Born and J. Franck). A. A. G.	834
Explosive reactions in gaseous media. General discussion held by the Faraday Society. W. P.	407
Explosives industry in America; History of — (A. P. van Gelder and H. Schlatter). J. Weir	1234
Farbstoffe; Künstliche organische — (H. E. Fierz-David). C. Hollmann	1134
Fats and waxes; Industrial chemistry of the — (T. P. Hilditch). H. M. Langton	986
Fermentations; Le problème des —; les faits et les hypothèses (M. Schoen with a preface by Dr. A. Fernbach)	199
Fermente; Die — und ihre Wirkungen (C. Oppenheimer). Nos. 0-13. A. R. Ling	408
Ferro allages; La fabrication des — (A. Contagne)	409
Fertilisers and soil improvers (W. Gardner). D. N. McA	989
Fertilisers; Artificial —, their chemistry, manufacture and application (P. Parrish and A. Odell)	448
Fertilisers—their sources, manufacture and uses (H. Cave). D. N. McAArthur	472
Fette und Ole; Technologie der — (K. Löffler). H. M. Langton	296
Flame and combustion in gases (W. A. Bone and D. T. A. Townsend)	921
Gas and gases (R. M. Caven). H. J. Holdman	407
Glas; Manufactured — (J. J. Morgan). Vol. I. A. Meade	1133
Geology; Physico-chemical — (R. H. Rastall). H. W. Greenwood	405
Glass; Constitution of — (edited by W. E. S. Turner). A. Cousen	1209
Glass; Defects in — (G. J. Peddle). A. B. Stale	790
Graphit (E. Ryschewitsch). P. May	274
Gravitation; Die universalität der — in den grossen und kleinsten systemen (H. Koller-Aeby). A. A. E.	778
Gum arabic, with special reference to its production in the Sudan (H. S. Blunt). P. May	39
Hydrogen ion concentration (L. Michels). Vol. I. Principles of the theory, translated by W. A. Portzweiz. E. B. R. Prideaux	404
Indicators, their use in quantitative analysis and in the colorimetric determination of hydrogen-ion concentration (I. M. Kolthoff, translated by N. H. Furman). E. B. R. Prideaux	404
Institution of Chemical Engineers; Transactions of the —. Vol. IV	701
Ions d'hydrogène (W. Koprowski). E. B. R. Prideaux	692
Instruments (Optical and general scientific) —, Catalogue of —. J. S. G. Thomas	709
Kalkbrennen; Das — mit besonderer Berücksichtigung des schlackelofens mit mischfeuerung und gewinnung von kohlenwasserstoffgasen (B. Block). W. G. Hancock	414
Keramischen Industrie; Warmewirtschaft in der — (W. Steger, edited by H. Pfützner, A. Nitzel and W. Pries). Part V. H. J. Holdman	815
Kautschuk-Technologie; Fortschritte in der — (F. Kirchhoff). Part XIII. Technische Fortschritte. Berichte, edited by B. Rasow. H. P. Stovov	1135
Kieselsäuregel; Das — und die Bleicharten (O. Kausch). E. C. W. Kokes	887
Kokes; Reaktionsfähigkeit des — (R. Mözner and F. Pistor). W. T. K. Brannholtz	1232
Kolloidchemie (E. Diesegang). Vol. VI. E. Hatschek	497
Kolloidchemische Technologie (edited by E. Diesegang). H. W. Greenwood	496
Lead storage battery (H. G. Brown). C. A. Klein	417
Lubrication and lubricants (L. Archbutt and R. M. Dreley). H. Moore	731
Lubrication in colliery practice (N. Slapkin). N. A. Audlogoff	416
Machinery; Textile bleaching, dyeing, printing and finishing — (A. J. Hall). L. L. Lloyd	947
Materie, elektrizität, energie. Grundlagen und ergebnisse der experimentellen forschung (W. Gerlach). Part VII. J. A. Cranston	985
Mechanics; Statistical — with applications to physics and chemistry (R. C. Tolman). J. S. G. Thomas	1135
Metallurgist's manual (T. G. Bauford and H. Harris). C. H. D.	1135
Metallurgy; Ancient Egyptian — (Major H. Garland and Prof. C. C. Bannister). J. Read	648
Metallurgy of cast iron (J. E. Hurst)	410
Metals; Corrosion of — (U. R. Evans). F. C. T.	409
Materials; Ancient Egyptian — (A. Lucas)	584
Microbiology (General); Laboratory manual in —. Third edition (edited by J. M. Jamieson). D. Ellis	647
Oil analysis; Short-hand-book of — (A. H. Gill). G. D. Eldon	752
Oil and colour chemist's handbook (translated by W. H. Hilton-Brown). J. A. F. Wilkinson	831
Oil and retortable materials (G. W. Halse). A. McCulloch	958
Oil industries; Chemistry of the — (J. E. Southcombe). H. M. Langton	37
Oil Policy; United States — (J. Lee)	327
Oils; Essential — (H. Finckmore). J. Read	37
Optical Convention; Proceedings of the —, 1926. Parts I and II (J. S. G. Thomas)	709
Oxides; Hydrous — (H. B. Weiser). P. C. L. Thorne	41
Paints, Enamel; Manufacture of — (D. Walt). P. May	416
Paper mill chemist (A. P. Stevens). J. T. Strachan	413
Parfumerie; Manuel du — (H. Askanson, edited by B. Soruet). E. J. Parry	834
Periodicity; The problem of physico-chemical — (E. S. Hodges and J. E. Myers). E. K. R.	406
Petroleum technology; Scientific principles of — (L. Gurwitsch, translated and revised by H. Moore). F. B. Thole	843

Reviews—continued.

Pharmacy; Four thousand years of — (C. H. La Wall). J. Read	990
Pharmacy; Remington's Practice of — (R. Fullerton Cook and C. H. La Wall). T. Tusting Cocking	295
Pharmacy; Text-book of — (A. O. Bentley). With a section on some biological aspects of pharmacy by H. S. Holden. O. T. Bennett	691
Phosphoric acid, phosphates, and phosphatic fertilisers (W. H. Wagman and H. W. Easterwood). N. M. Comber	1210
Photographic chemicals and chemistry (J. Southworth and T. L. J. Bentley). H. W. Greenwood	417
Photomicrography; Practical — (J. E. Barnard and F. V. Welch)	495
Photosynthesis (H. A. Spoehr). E. C. C. Baly	472
Plant products (S. H. Collins and G. Redington). C. T. G.	12
Potash; A review, estimate and forecast (J. W. Turrentine). J. Hendrick	199
Projektierungen und apparaturen für die chemische industrie. I. Gruppe (J. L. C. Eckelt and O. Gasenar). J. W. Mc.D.	710

Chemical Engineering Group continued.	
Proceedings	433
Pyrometry in industry; Thermo-electric and resistance	57
J. A. Hall	81
Chemists' Handbook, Congress of —	687, 700
Coal cleaning conference	1021
Committees of Council for 1927—28	368
Honorary Treasurer	1021
Representatives on outside bodies for 1927—28	
Sections, News from the:	
American Section: Carbon. Activated — industry. P. Mahler	578
Carbon black; Production of — and lamp black. — Lewis	578
Coal, Bituminous; Preparation of —: Its scope and significance to the user. F. R. Wadleigh	1221
Coal preparations; Importance of — in the manufacture of gas and coke. H. J. Rose	1121
Perkin Medal meeting	124
Rensen, Ira; Resolution regarding —	509
Sewage and trade wastes. E. Barlow	266, 288
Birmingham and Midland Section. Analysis; Metallurgical spectroscopy — F. Twyman	185
Annual dinner with Institute of Chemistry	81
Biochemical laboratories; Recent work in the University — A. R. Ling	1204
Hydroxy acids; Rotatory dispersion of certain derivatives of — C. E. Wood	57
Light; Ultra-violet — A. A. King	423, 555
Phenols; Removal and recovery of — from ammonia sulphate still effluents. D. W. Parkes	288
Resins; Commercial synthetic — and their products. H. W. Rowell	234
Bristol Section: Carbonisation; Low-temperature — C. H. Lander	1205
Power; Production of — from town's refuse. J. W. Reber and A. Scott	119
Science and Industry. G. Gray	213
Silk, Viscose artificial; Manufacture of — H. R. S. Clotworthy	1085
Vitamins in relation to chemistry and medicine. F. H. Carr	930
Water softening. G. Hilder	31
Edinburgh and East of Scotland: Annual business meeting	310
Annual report	339
Chemical formulae of long ago. R. M. Cayen	1101
Electro-syntheses. J. Walker	1176
Fire risks in industry. A. M. Cameron	640
Microscope; Use of the — in qualitative analysis. B. D. W. Laiff	190
Fuel Section: Carbonisation; Low-temperature — C. H. Lander	1205
Coal trouble; A new diagnosis of — C. J. T. Cronshaw	1177
Joint meeting with Yorkshire Section	125
Glasgow Section: Annual business meeting	319
Micrometer, Plezo; Demonstration of a new — J. Stincham	160
Naphthas and their uses. C. Chapman	1177
Oils; Volatility and carbonisation of — for cylinder lubrication. J. W. Donaldson	83
Rubber manufacture; Sulphur in — D. Y. Tols	1177
Rubber, raw; Effect of heat on — in the presence and absence of air. J. D. Fry and B. D. Porritt	166
Rubber, Vulcanised; Hardness testing of —	160
Sugar, Beet; Dediclation (De Vecchi) process of — manufacture and the drying plant used. C. E. Garrett and G. W. Riley	994
Textile industry; Research in the — G. M. Keyworth	1086
Liverpool Section: Biochemical aspects of the nature of life. J. C. Drummond	290
Chemical industries and Mercersburg. A. Holt	1022
Fuels for internal combustion engines. F. L. Nathan	198
Joint meeting with the Manchester Section	213
Oil pollution of seas and harbours — and a remedy. C. S. Garland	1207
Petroleum refining; Modern improvements in — A. E. Dunstan	1121
Physico-chemical and biochemical aspects of malignant growths. W. C. M. Lewis	84
London Section: Annual meeting, 1927	439
Coal, Bituminous; International conference on —	354
Gas industry, The —, past, present and future. W. J. A. Butterfield	908
Glass industry; Recent progress in the — W. E. S. Turner	234
Hydrogenation of fatty acids and neutral oils. R. G. Pelly	1043
Hydrogenation; Selective — K. A. Williams	1043
Insecticides; Recent investigations on contact — J. Tattersfield and C. T. Gillingham	410
Liquids; Automatic analysis of — and its application to control of water-softening plants. H. S. Hatfield	1149
Nickel catalyst; Activity of a — R. J. Lush	1043
Oils; Recent advances in the hydrogenation of — E. H. Bolton	1043
Photographic sensitivity. T. Slater Price	119, 172
Sewage disposal; Modern methods of — W. Butler and J. H. Gost	6
Manchester Section: Benzene; Normal amyl — and some of its derivatives, Part 2. L. Gay Radcliffe and R. L. F. Robert	58
Chemical control in the cotton bleaching industry. D. Gilden	213
Chemotherapy; Some new principles in — A. G. Green and M. Coplans	1043
Coal trouble; A new diagnosis of — J. A. Bowie	1177
Colour; The constants of — hue, purity and luminosity. W. Gamble	126
Joint meeting with the Chemical Engineering Group and the Institution of Mechanical Engineers	310
Lubrication. W. R. Ormandy	310
National Physical Laboratory; Work of the — W. Rosenblum	320
Rubber solvents. D. F. Twiss	59
Standardisation in chemical analysis. W. H. Roberts	58

Sections, News from the—continued.

	PAGE
Manchester Section—continued.	
Sulphur atom; Influence of the — on the reactivity of adjacent atoms or groups G. M. Bennett and A. L. Hock	59
Toluidines; Estimation of mixtures of the isomeric — H. H. Evans and N. Strufford	58
Montreal Section: Filtration; Theory and practice of industrial distillation and — C. N. Robinson	1044
Nitric acid: Synthetic — C. O. Brown	1173
Newcastle Section: Hydrogen sulphuretted; Action of — upon mono-hydrated ferric oxide T. G. Pearson	266
Saville Shaw Medal presentation	260
Specific gravity: Apparent — and porosity; A comparison of various methods G. M. Nave	206
Nottingham Section, Alkaloids; Indole group of the — R. Robinson	1207
Biochemical and physiological reactions; Accessory agents in — A. R. Ling	320
Chlorine; Action of — and hypochlorous acid on wool S. R. and E. R. Trotman	1101
Formaldehyde; Action of — on wool S. R. and E. R. Trotman	1101
Fuels, liquid; Production of — from coal J. G. King	59
Soaps in textile industries J. Alkon	995
Ottawa Section, Alcohol; Determination of — in solutions containing acetone J. Macoun	1149
Chemical study of a new system of grassland management for increased protein production F. P. Shutt	1044
Enamels as applied to pulbils and varnishes C. E. Watson	321
Enamels, Vitreous; Outline of the manufacture and application of — W. Mayor	1149
Lignum; Chemistry of — L. P. Goodwin	244
Metallurgical problems; Some — D. W. Stewart	7
Silver; Electro-plating and electro-refining of — W. C. Gardner	440
Patents, with particular reference to the public service A. F. MacHae	525
Science; Borderland — and its bearing on industry and civilisation H. Hibbert	321
Seed analysis G. E. Gratton	141
Society of Chemical Industry in Ottawa R. D. Whitmore	1041
